```

Figure 24: Relational interpretation of types

2 Logical relation

We use $\lambda x.t$ as syntatic sugar for fix f(x).t when f does not show in t.

Lemma 1 (Monotonicity).

- 1. If $k' \le k$ and $G \subseteq G'$, then $(\tau)_{G,k} \subseteq (\tau)_{G',k'}$.
- 2. If $k' \le k$ and $g \subseteq g'$, then $[A]_{g,k} \subseteq [A]_{g',k'}$.
- 3. If $k' \leq k$ and $G \subseteq G'$, then $(\tau)_{G,k}^{E,D} \subseteq (\tau)_{G',k'}^{E,D}$.
- 4. If $k' \le k$ and $g \subseteq g'$, then $[A]_{g,k}^{E,(L,U)} \subseteq [A]_{g',k'}^{E,(L,U)}$.
- 5. If $k' \le k$ and $G \subseteq G'$, then $(|\Gamma|)_{G,k} \subseteq (|\Gamma|)_{G',k'}$
- 6. If $k' \le k$ and $g \subseteq g'$, then $[\![\Omega]\!]_{g,k} \subseteq [\![\Omega]\!]_{g',k'}$

This monotonicity lemma shows that the value interpretation, expression interpretation, and our interpretation of either the unary context or relational context are monotone. Take the value interpretation of relational type as an instance, if we know that a pair of values (v_2, v_2) is in the value interpretation of certain relational type τ for some step k in certain world G, then this pair of values should also be in the value interpretation of τ for some smaller step k' in a bigger world G'. We can read other cases in a similar way.

Proof. The proof of the 6 statements will be organized as follows. The statements of (1) and (3), related to the interpretations of relational types, are first proved simultaneously by induction on τ . Similarly, the statements about the interpretations of the unary types, (2), and (4) are proved simultaneously by induction on the unary type A. The statements about the contexts, (5) and (6), follows directly from statement (1) and (2).

Lemma 2 (Heap extension). If $(H_1, H_2) \vDash_{G,k} P$, then for any H'_1, H'_2 , $(H_1 \uplus H'_1, H_2 \uplus H'_2) \vDash_{G,k} P$.

Proof. It is simply proved by case analysis on P.

Lemma 3 (Heap evaluation extension). If H; $t \Downarrow_f^{c,k} H_1$; v, then for any H', $H \uplus H'$; $t \Downarrow_f^{c,k} H_1 \uplus H'$; v.

Proof. The proof is by induction on evaluation derivation on operation semantics.

Lemma 4 (Evaluation cost soundness).

- 1. If $\vdash_L^U t : A \text{ and } t \downarrow^c v, \text{ then } L \leq c \leq U$.
- 2. If $\vdash_L^U t: \{P\} \exists \gamma: A \{Q\} \text{ and } t \downarrow_p^c v, \text{ then } L + L' \le c \le U + U'.$
- 3. If $\vdash_L^U t: \{P_1\}_{L_1}^{U_1} \exists \gamma_1: \{P_2\}_{L_2}^{U_2} \exists \gamma_2: \dots \{Q_2\} \{Q_1\} \ and \ t; H \Downarrow_p^{c_1} v_1; H1 \ and \ H_1; v_1 \Downarrow_p^{c_2} v_2; H_2 \ etc, \ then \ L+L_1+L_2+\dots L_n \leq c_1+c_2+\dots+c_n \leq U+U_1+U_2+\dots+U_n.$
- 4. If $\vdash t_1 \ominus t_2 \lesssim D : \tau$ and $t_1 \Downarrow_p^{c_1} v_1$ and $t_2 \Downarrow_p^{c_2} v_2$, then $c_1 c_2 \leq D$.
- 5. If $\vdash t_1 \ominus t_2 \lesssim D : \{P\} \stackrel{\text{diff}(D')}{\exists \gamma : \tau} \{Q\} \text{ and } t_1 \Downarrow_p^{c_1} v_1 \text{ and } t_2 \Downarrow_p^{c_2} v_2, \text{ then } c_1 c_2 \leq D + D'.$
- 6. If $\vdash t_1 \ominus t_2 \lesssim D : \{P_1\}^{\mathsf{diff}(D_1)} \exists \gamma_1 : \{P_2\}^{\mathsf{diff}(D_2)} \exists \gamma_2 : \dots \{Q_2\} \{Q_1\} \ and \ t; H \Downarrow_p^{c_1} v_1; H1 \ and \ v_1; H_1 \Downarrow_p^{c_2} v_2; H_2 \ then \ c_1 c_2 \leq D + D_1 + D_2 \dots D_n.$

Proof. (1) is directly proved from the definition of unary expression interpretation. If $\vdash_L^U t : \tau$, then $t \in [\![\tau]\!]_{G,k}^{E,(L,U)}$, unfold the definition, we get : $L \le c \le U$ and $t \Downarrow^c v$.

- $(2) \ t \in \llbracket \{P\} \ \exists \gamma \colon A \ \{Q\} \rrbracket_{G,k}^{E,(L,U)}, \ t \ \downarrow^{c_1} v' \ \text{and} \ v' \ \downarrow_f^{c_2} v \ \text{unfold the definition, we know} \ c = c_1 + c_2 \ \text{and} \ L \leq c_1 \leq U \ \text{and} \ L' \leq c_2 \leq U'. \ \text{It is proved.}$
- and $L' \le c_2 \le U'$. It is proved. (3) $t \in [\{P_1\}_{L_1}^{U_1} \exists \gamma_1 : \{P_2\}_{L_2}^{U_2} \exists \gamma_2 : \dots \{Q_2\} \{Q_1\}]_{G,k}^{E,(L,U)}$. Unfold the definition, we can get : $L + L_1 + L_2 + \dots L_n \le c_1 + c_2 + \dots + c_n \le U + U_1 + U_2 + \dots + U_n$. This case is proved.
- (4) From the fundamental theory, If $\vdash t_1 \ominus t_2 \lesssim D : \tau$, we know closed terms (t_1, t_2) in the interpretation of relational type τ , $(\![\tau]\!]_{G,k}^{E,D}$, unfold the definition, $c_1 c_2 \leq D$ is proved.
- (5) From the fundamental theory, If $\vdash t_1 \ominus t_2 \lesssim D : \{P\} \stackrel{\text{diff}(D')}{\exists \gamma : \tau} \{Q\}$, we know closed terms (t_1, t_2) in the interpretation $(\{P\} \stackrel{\text{diff}(D')}{\exists \gamma : \tau} \{Q\}) \stackrel{E,D}{G,k}$, unfold the definition, $c_1 c_2 \leq D + D'$ is proved.
- (6) From the fundamental theory, If $\vdash t_1 \ominus t_2 \lesssim D : \{P_1\}^{\operatorname{diff}(D_1)} \exists \gamma_1 : \{P_2\}^{\operatorname{diff}(D_2)} \exists \gamma_2 : \dots \{Q_2\} \{Q_1\}$, we know closed terms (t_1, t_2) in the interpretation of nested relational type τ , $\|\tau\|_{G,k}^{E,D}$, unfold the definition level by level, $c_1 c_2 \leq D + D_1 + D_2 \cdots + D_n$ is proved.

Lemma 5 (Well-formedness).

- 1. If Δ ; Φ ; $\Gamma \vdash t_1 \ominus t_2 \lesssim D$: τ , then $FV(t_1) \subseteq dom(\Gamma)$ and $FV(t_2) \subseteq dom(\Gamma)$.
- 2. If $\Delta; \Phi; \Omega \vdash_L^U t : A$, then $FV(t) \subseteq dom(\Omega)$.

Proof. The proof is by induction on the typing derivations.

Lemma 6 (Value Projection).

- 1. If $(v_1, v_2) \in (\tau)_{G,k}$, then $\forall k. v_1 \in [|\tau|_1]_{G|_1,k}$ and $v_2 \in [|\tau|_2]_{G|_2,k}$.
- 2. If $(\sigma_1, \sigma_2) \in (\Gamma)_{G,k}$, then $\forall k.\sigma_1 \in (|\Gamma|_1)_{G|_1,k}$ and $\sigma_2 \in (|\Gamma|_2)_{G|_2,k}$.

Proof. Proof of Statement (1) is by induction on $(\tau)_{G,k}$. Proof of Statement (2) follows by proof of (1). \Box

Lemma 7 (Heap monotonicity).

- 1. If $k' \le k$ and $G' \supseteq G$, then $(H_1, H_2) \vDash_{G,k} P \Rightarrow (H_1, H_2) \vDash_{G',k'} P$
- 2. If $k' \le k$ and $g' \supseteq g$, then $H \vDash_{g,k} P \Rightarrow H \vDash_{g',k'} P$

Proof. proof of statement (1)

Assume $k' \le k$ and $G' \supseteq G$, and we have $H_1, H_2 \vDash_{G,k} P$, TS: $H_1, H_2 \vDash_{G',k'} P$ Unfold the definition of $H \vDash_{G',k'} P$, By case analysis on P, there are three cases:

case 1: P=empty It is vacuously true that $H \vDash_{g',k'}$ empty.

case 2: P= $\gamma \rightarrow \beta$, From $H_1, H_2 \vDash_{G,k} \gamma \rightarrow \beta$, we know:

$$G(\gamma) = (l_1, l_2, \tau, n) \tag{1}$$

$$\forall i \le n. (H_1(l_1)[i], H_2(l_2)[i]) \in \{\tau\}_{G,k-1}$$
(2)

$$\forall i \le n. (H_1(l_1)[i] \ne H_2(l_2)[i]) \Rightarrow i \in \beta \tag{3}$$

We conclude that $G'(\gamma) = (l_1, l_2, \tau, n)$ from assumption $G' \supseteq G$ and $\forall i \le n. H(l)[i] \in (\tau)_{G', k'}$ by Lemma 1 on (2).

case 3: P= $P_1 \star P_2$. Suppose $\exists n.P = \{\gamma_i \to \beta_i\}$ for $i \in [1,...,n]$.

Unfold the definition of $H_1, H_2 \vDash_{G,k} \{\gamma_i \to \beta_i\}$ for $i \in [1, ..., n]$.

We know there exists $H_1 = (h_1^1) \uplus (h_1^2) \uplus \cdots \uplus (h_1^n)$ and $H_2 = (h_2^1) \uplus (h_2^2) \uplus \cdots \uplus (h_2^n)$ and $G = G_1 \uplus G_2 \uplus \cdots \uplus G_n$

so that $h_1^i, h_2^i \vDash_{G_i,k} \gamma_i \rightarrow \beta_i$ for any i.

Since $G' \supseteq G$, we know there exists $G'_i \supseteq G_i$ s.t. $G' = G'_1 \uplus G'_2 \uplus \cdots \uplus G'_n \land \forall i.G'_i \supseteq G_i$

Use the conclusion of case 2, we know:

 $\forall i \in [1, n]. h_1^i, h_2^i \vDash_{G_i', k'} \gamma_i \rightarrow \beta_i.$

proof of statement (2)

Assume $k' \le k$ and $g' \supseteq g$, and we have $H \vDash_{g,k} P$. TS: $H \vDash_{g',k'} P$

Unfold the definition of $H \vDash_{g',k'} P$, by case analysis on P, there are three cases:

case 1: P=empty, It is vacuously true that $H \vDash_{g',k'}$ empty.

case 2: $P = \gamma \rightarrow \beta$. From $H \models_{g,k} \gamma$, we know:

$$g(\gamma) = (l, A, n) \tag{1}$$

$$\forall i \le n. H(l)[i] \in [A]_{g,k-1} \tag{2}$$

We conclude that $g'(\gamma) = (l, A, n)$ from assumption $g' \supseteq g$ and $\forall i \le n.H(l)[i] \in [\![A]\!]_{g',k'}$ by Lemma 1 on (2).

case 3: P = P * Q

Assume $p = \{\gamma_i\}$ for $i \in [1, ..., n]$.

From the definition of $H \vDash_{g,k} \{\gamma_1, \gamma_2, ..., \gamma_n\}$, we know

 $\exists H = (h_1^1) \uplus (h_1^2) \uplus \cdots \uplus (h_1^n) \text{ and } g = g_1 \uplus g_2 \uplus \cdots \uplus g_n \text{ s.t. } h_1^i \vDash_{g_i,k} \gamma_i \to \beta_i \text{ for any i.}$

Since $g' \supseteq g$, we know: $\exists g'_1, g'_2, \dots, g'_n . g' = g'_1 \uplus g'_2 \uplus \dots \uplus g'_n \land \forall i . g'_i \supseteq g_i$.

By the conclusion of case 2. we know: $h_1^i \vDash_{g',k'} \gamma_i$ for any i.

This completes the proof of statement (2).

Lemma 8 (Value interpretation containment).

- 1. If $(v_1, v_2) \in (\tau)_{G,k}$, then $(v_1, v_2) \in (\tau)_{G,k}^{E,0}$
- 2. If $v \in [A]_{g,k}$, then $\forall t \ge 0. v \in [A]_{g,k}^{E,(0,t)}$

Proof. (1) Assume $(v_1, v_2) \in (\tau)_{G,k}(*)$

TS:
$$(v_1, v_2) \in (\tau)_{G,k}^{E,0}$$

Following the definition of $\{\tau\}_{G,k}^{E,0}$, we get: $v_1 \downarrow^0 v_1$ and $v_1 \downarrow^0 v_1$ and $0 - 0 \le 0$ and $(v_1, v_2) \in \{\tau\}_{G,k-0}$. This completes the proof.

Proof. Assume $v \in [A]_{g,k}(*)$

TS: $\forall t \geq 0. v \in \llbracket A \rrbracket_{g,k}^{E,(0,t)}$ Following the definition of $\llbracket A \rrbracket_{g,k}^{E,(0,t)}$. We know $v \downarrow^0 v$ and $v \in \llbracket A \rrbracket_{g,k}$. This completes the proof.

Lemma 9 (Value evaluation). $v \downarrow^0 v$

Proof. By induction on the value term v.

Lemma 10 (heap projection). If $(H_1, H_2) \vDash_{G,k} \gamma_i \rightarrow \beta_i, i \in (1, n)$, then $\forall T, T'.H_1 \vDash_{G|_1,k} \gamma_i \rightarrow T_i$ and $H_2 \vDash_{G|_2,k} \gamma_i \rightarrow T'_i$

Proof. Suppose $H_1 = h_1 \uplus h_2 \dots h_n$ and $H_2 = h'_1 \uplus h'_2 \dots h'_n$

Unfold $(h_i, h'_i) \models_{G,k} \gamma_i \rightarrow \beta_i$, we know:

$$G(\gamma) = (l_1, l_2, \tau, n) \tag{1}$$

$$\forall i \le n. (h_i(l_1)[i], h_i'(l_2)[i]) \in (\tau)_{G,k-1}$$
(2)

From (1), we know:

$$G|_{1}(\gamma) = (l_{1}, \gamma, n) \tag{3}$$

$$G|_{2}(\gamma) = (l_{2}, \gamma, n) \tag{4}$$

From(2) and Lemma (Value projection) and ,we know:

$$\forall i \le n. (H_1(l_1)[i]) \in [|\tau|_1]_{G|_1, k-1}$$
(5)

$$\forall i \le n. (H_2(l_1)[i]) \in [\![|\tau|_2]\!]_{G|_2, k-1} \tag{6}$$

Using (3)(5), (4)(6), this lemma is proved.

Lemma 11 (heap subtyping). If $\vdash \delta : \Delta$ and $\vdash \delta \oplus$ and $\Delta : \Phi \vdash P \subseteq P'$ and $H_1, H_2 \vdash_{G,k} \delta P$, then $H_1, H_2 \vdash_{G,k} \delta P$ $\delta P'$.

Proof. Assume we have: $H_1, H_2 \vDash_{G,k} \delta P$.

We want to show : H_1 , $H_2 \vDash_{G,k} \delta P'$.

Suppose $\exists n.\delta P = \{\gamma_i \rightarrow \beta_i\}$ for $i \in [1,...,n]$.

Unfold the definition of $H_1, H_2 \vDash_{G,k} \{\gamma_i \rightarrow \beta_i\}$ for $i \in [1, ..., n]$.

We know there exists $H_1 = (h_1^1) \uplus (h_1^2) \uplus \cdots \uplus (h_1^n)$ and $H_2 = (h_2^1) \uplus (h_2^2) \uplus \cdots \uplus (h_2^n)$ and $G = G_1 \uplus G_2 \uplus \cdots \uplus G_n$ so that $h_1^i, h_2^i \vDash_{G_i,k} \gamma_i \rightarrow \beta_i$ for any i.

Unfold the definition of Δ ; $\Phi \vDash \delta P \subseteq \delta P'$, we know: $\delta P' = \{\gamma_i \to \beta_i'\}, i \in [1, ..., n]$.

STS: $\forall i \in [1, ..., n]. \exists x_1^i, x_2^i \vDash_{G_i, k} \gamma_i \rightarrow \beta_i'$ where $H_1 = (x_1^1) \uplus (x_1^2) \uplus \cdots \uplus (x_1^n)$ and $H_2 = (x_2^1) \uplus (x_2^2) \uplus \cdots \uplus (x_2^n)$ Pick i.Choose $x_1^i = h_1^i$ and $x_2^i = h_2^i$, by unfolding the definition of $h_1^i, h_2^i \vDash_{G_i,k} \gamma_i \to \beta_i$. we have: $G_i(\gamma_i) = (l_1^i, l_2^i, \tau^i, n)$ and $\forall m \le n.(h_1^i(l_1^i[m]) \ne h_2^i(l_2^i[m]) \Rightarrow m \in \beta_i$

Since we know $\beta_i \subseteq \beta_i'$, we get: $\forall i \in [1, ..., n]$. $G_i(\gamma_i) = (l_1^i, \tilde{l}_2^i, \tau_i, n) \land \forall m \le n. (x_1^i(m) \ne x_2^i(m)) \Rightarrow m \in \beta_i'$.

For any $i \in [1, ..., n]$, choose $x_1^i = h_1^i$ and $x_2^i = h_2^i$, we know: $x_1^i, x_2^i \models_{G_i, k} \gamma_i \rightarrow \beta_i'$ We also know $H_1 = (x_1^1) \uplus (x_1^2) \uplus \cdots \uplus (x_1^n)$ and $H_2 = (x_2^1) \uplus (x_2^2) \uplus \cdots \uplus (x_2^n)$ from assumption.

This completes the proof of the lemma.

Lemma 12 (Subtyping soundness). 1. If Δ ; $\Phi \models \tau \sqsubseteq \tau'$ and $\vdash \delta : \Delta$ and $\vdash \Phi \delta$ and $(v, v') \in (\delta \tau)_{G,k}$, then $(v, v') \in (\delta \tau')_{G,k}$.

- 2. If Δ ; $\Phi \models A \sqsubseteq A'$ and $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(v) \in [\![\delta A]\!]_{g,k}$, then $(v) \in [\![\delta A']\!]_{g,k}$.
- 3. If Δ ; $\Phi \models \tau \sqsubseteq \tau'$ and $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(t, t') \in (\delta \tau)_{G, k}^{E, D}$ and $D \leq D'$, then $(t, t') \in (\delta \tau')_{G, k}^{E, D'}$.
- 4. If Δ ; $\Phi \models A \sqsubseteq A'$ and $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $t \in \llbracket \delta A \rrbracket_{g,k}^{E,(L,U)}$ and $L' \leq L$ and $U \leq U'$, then $t \in \llbracket \delta A' \rrbracket_{g,k}^{E,(L',U')}$.
- 5. If Δ ; $\Phi \models \tau \sqsubseteq \tau'$ and $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $\forall i \in \{1,2\}$. $(v) \in [\![\delta \tau|_i]\!]_{G|_i,k}$, then $v \in [\![\delta \tau'|_i]\!]_{G|_i,k}$.
- 6. If Δ ; $\Phi \models \tau \sqsubseteq \tau'$ and $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $\forall i \in \{1,2\}$. (e) $\in [|\delta \tau|_i]_{G \mapsto k}^{E,(L,U)}$ and $L' \leq L$ and $U \leq U'$, then $e \in [\![|\delta \tau'|_i]\!]_{G|_i,k}^{E,(L,U)}.$

Proof Statements (1) and (2) (5) are by proven simultaneously by induction on the subtyping derivation. (3),(4),(6) will be proved first.

Proof. **Proof of statement (3)** Assume that $\Delta; \Phi \models \tau \sqsubseteq \tau'$ and $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(t, t') \in (\delta \tau)_{G, k}^{E, D}$ and

TS: $(t, t') \in (\delta \tau')_{G,k}^{E,D'}$.

Assume that 1) $t \Downarrow^{s,c} v, 2$) $t' \Downarrow^{s',c'} v', 3$) s < k. Unfold the assumption $(t,t') \in (\delta \tau)_{G,k}^{E,D}$ using assumption (1)(2)(3), we know that $c-c' \le D(a)$, $(v,v') \in (\delta \tau)_{G,k}^{E,D}$

we conclude: $c - c' \le D'$ from assumption $D \le D'$. and by IH1 on (b), we know $(v, v') \in (\delta \tau')_{G,k-s}$.

Proof of statement (4) Assume Δ ; $\Phi \models A \sqsubseteq A'$ and $\vdash \delta : \Delta$ and $\vdash \Phi \delta$ and $e \in [\![\delta A]\!]_{g,k}^{E,(L,U)}$ and $L' \leq L$ and $U \le U'$. We want to show: $t \in [\delta A]_{g,k}^{E,(L,U)}$

Assume: $t \downarrow^{s,c}$, s < k.

Unfold the assumption $t \in [\![\delta A]\!]_{g,k}^{E,(L,U)}$, we know: $L \le c \le U(a)$, $v \in [\![\delta A]\!]_{g,k-s}(b)$. Then, we conclude: $L' \le c \le U'$ from assumption. By IH2 with the first premise on (b), we get: $v \in [\![\delta A]\!]_{g,k-s}(b)$.

Proof of statement (6) Assume Δ ; $\Phi \models \tau \sqsubseteq \tau'$ and $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $\forall i \in \{1,2\}$. $(e) \in [\![|\delta\tau|]\!]_{G[:,k]}^{E,(L,U)}$ and

TS: $t \in [|\delta \tau'|_i]_{G|_i,k}^{E,(L,U)}$

Assume: $t \parallel^{s,c}$, s < k. Unfold the assumption $t \in [\![\delta \tau']_i]\!]_{G_{i,k}}^{E,(L,U)}$, we know: $L \le c \le U(a)$, $v \in [\![\delta \tau']_i]\!]_{G_{i,k}-s}(b)$. We conclude: $L' \le c \le U'$ from assumption, by IH5 with the first premise on (b), we get: $v \in [|\delta \tau'|_i]_{G|_i,k-s}$

Proof of statement (1)

The proof is by induction on the subtyping derivation, we will detail some of the most interesting cases.

$$\frac{\Sigma; \Delta; \Phi \models \tau \sqsubseteq \tau' \qquad \Delta; \Phi \models D \leq D' \qquad \Delta; \Phi \models P' \subseteq P \qquad \Sigma, \vec{\gamma}_1 : \vec{\mathbb{L}}; \Delta; \Phi \models Q \subseteq Q' \qquad \Sigma \models \vec{\gamma}_1 \sqsubseteq \vec{\gamma}_2}{\text{diff}(D)} \text{s-RM}$$

$$\Sigma; \Delta; \Phi \models \{P\} \; \exists \vec{\gamma}_1 : \tau \; \{Q\} \sqsubseteq \{P'\} \; \exists \vec{\gamma}_2 : \tau' \; \{Q'\}$$

Assume δ such that $\vdash \delta : \Delta$ and $\models \delta \Phi$. Assume also that we have G, k, v_1, v_2 such that

$$(\nu_1, \nu_2) \in \left(\left\{ \delta P \right\} \, \exists \vec{\gamma_1} : \delta \tau \, \left\{ \delta Q \right\} \right)_{\delta G, k} \tag{1}$$

We want to show

$$(\nu_1, \nu_2) \in \{\{\delta P'\} \exists \vec{\gamma}_2 : \delta \tau' \{\delta Q'\}\}_{\delta G, k}$$
 (2)

By definition, consider $G_1 \supseteq \delta G$, $k_1 \le k$, $k_2 < k$, H_1 , H_2 and assume

$$(H_1,H_2) \vDash_{G_1,k_1} \delta P' \wedge H_1; v_1 \downarrow_f^{k_2} \wedge H_2; v_2 \not \uparrow^f$$

Since Δ ; $\Phi \models P' \subseteq P$ we also have $(H_1, H_2) \models_{G_1, k_1} \delta P$.

Thus, by Equation (1) we have that there exist $G_2 \supseteq G_1$, H'_1 , H'_2 , v'_1 , v'_2 , c_1 , c_2 such that

$$v_1; H_1 \Downarrow_f^{c_1, k_2} v_1'; H_1' \wedge v_2; H_2 \Downarrow_f^{c_2, k_2} v_2'; H_2' \wedge (H_1', H_2') \models_{G_2, k_1 - k_2} \delta Q \wedge (v_1', v_2') \in \{\!\!\{ \delta\tau \}\!\!\}_{G_2, k_1 - k_2} \wedge c_1 - c_2 \leq \delta D \wedge (c_1', c_2') \wedge (c_1', c_2') \wedge (c_2', c_2') \wedge (c_2',$$

Since Σ , $\vec{\gamma_1}$: $\vec{\mathbb{L}}$; Δ ; $\Phi \models Q \subseteq Q'$ we also have $(H_1', H_2') \models_{G_2, k_1 - k_2} \delta Q'$ by using Lemma 11 on $(H_1', H_2') \models_{G_2, k_1 - k_2} \delta Q'$

Additionally, from Δ ; $\Phi \models \tau \sqsubseteq \tau'$ and Δ ; $\Phi \models D \leq D'$

By IH on the first premise, we also get

 $(v'_1, v'_2) \in (\delta \tau')_{G_2, k_1 - k_2}$ and $c_1 - c_2 \le \delta D'$ respectively.

So we can derive Equation (2), and this completes the proof of case-sub-r-monad.

$$\begin{array}{ccc} & \operatorname{exec}(L,U) & \operatorname{exec}(L',U') & \operatorname{diff}(U-L') \\ \Sigma;\Delta;\Phi \models U \ (\{\gamma_i \rightarrow T_i\} \ \exists \overrightarrow{\gamma_1}: A_1 \ \{Q_1\}, \{\gamma_i \rightarrow T_i'\} \ \exists \overrightarrow{\gamma_2}: A_1 \ \{Q_2\}) \sqsubseteq \{\gamma_i \rightarrow \beta_i\} \ \exists \overrightarrow{\gamma_1}, \overrightarrow{\gamma_2}: U(A_1,A_2) \ \{\gamma_i \rightarrow \beta_i \cup T_i \cup T_i'\} \ \exists \overrightarrow{\gamma_2}: A_1 \ \{Q_2\} \} \\ \end{array}$$

Pick G,k,v,v', we assume $\vdash \delta : \Delta$ and $\models \Phi \delta$, we have:

$$\underbrace{\operatorname{exec}(L,U)}_{(\nu,\nu') \in (\delta U)} \underbrace{\operatorname{exec}(L',U')}_{(\lambda_i \to T_i)} \exists \vec{\gamma}_1 : A_1 \{Q_1\}, \{\gamma_i \to T_i'\} \exists \vec{\gamma}_1 : A_2 \{Q_2\}) \rangle_{G,k}$$
 (a)

 $\text{TS: } (\nu, \nu') \in \big(\!\!\big[\delta \mid \!\! \gamma_i \rightarrow \beta_i \!\!\big] \; \exists \vec{\gamma_1}, \vec{\gamma_2} : \overset{\text{diff}(U-L')}{U(A_1, A_2)} \; \{\gamma_i \rightarrow \beta_i \cup T_i \cup T_i' \!\!\big] \big)_{G,k}$

Unfold the definition of $\{\delta : \{\gamma_i \to \beta_i\} \exists \vec{\gamma_1}, \vec{\gamma_2} : U(A_1, A_2) : \{\gamma_i \to \beta_i \cup T_i \cup T_i'\}\}_{G,k}$.

Pick $G' \supseteq G, k' \le k, k'' < k, H_1, H_2$, we assume $(H_1, H_2) \models_{G', k'} \gamma_i \rightarrow \beta_i(1), H_1; v \downarrow_f^{k''} \land H_2; v' \not \uparrow f$ (2).

Still To Show: $\exists G'' \supseteq G, H'_1, H'_2, v_1, v'_1, H_1; v \downarrow_f^{c_1, k''} H'_1; v_1(3), H_2; v' \downarrow_f^{c_2} H'_2; v'_1(4) H'_1, H'_2 \vDash_{G'', k' - k''} \gamma_i \rightarrow \beta_i \cup T'_i(5), (v_1, v'_1) \in (U(A_1, A_2))_{G'', k' - k''}(6).$

From (a), unfold its definition of $\|\delta U\left(\{\gamma_i \to T_i\} \ \exists \vec{\gamma_1}: A_1 \ \{Q_1\}, \{\gamma_i \to T_i'\} \ \exists \vec{\gamma_1}: A_2 \ \{Q_2\}\right)\|_{G,k}$

$$\forall k', v \in \llbracket \{ \gamma_i \to T_i \} \ \exists \vec{\gamma}_1 : A_1 \ \{Q_1\} \rrbracket_{G|_1,k'} \tag{b}$$

$$\begin{array}{c} \operatorname{exec}(L',U') \\ \forall \, k', \, v' \in [\{\gamma_i \to T_i'\} \, \exists \vec{\gamma_2} : A_2 \, \{Q_2\}]_{G|_2,k'} \end{array}$$

Pick k' as k, unfold its definition in (b), we already got: $G'|_1 \supseteq G|_1$ and $k' \le k$ and k'' < k' and $H_1; v \downarrow_f^{k''}$ and $H_1 \models_{G'|_1,k'} \gamma_i \to T_i$ holds by using Lemma (heap projection) on (1).

Derive from the definition, we know: $\exists g_1'' \supseteq G'|_1, H_1', v_1., H_1; v \downarrow_f^{c_1,k''} H_1'; v_1(d), H_1' \models_{g_1'',k'-k''} Q_1(e), v_1 \in \llbracket A_1 \rrbracket_{g_1'',k'-k''}(f) \ \forall i.g_1'(\gamma_i) = (l_i,A,m) \Rightarrow H_1(l)[n] \neq H_1'(l)[n] \Rightarrow n \in T_i(*).$

Unfold its definition in (c), we already got: $G'|_2 \supseteq G|_2$ and $k' \le k$ and k'' < k' and H_2 ; $v \downarrow_f$ and $H_2 \vDash_{G'|_2,k'} \gamma_i \to T'_i$ holds by using Lemma 10 (heap projection) on (1).

There are two cases for H_2 ; $v \downarrow_f \Rightarrow H_2$; $v \downarrow_f^{k''}$:

- 1. H_2 ; $v\downarrow_f^{k_1}$ and $k_1>k'$. Using Lemma 1, we get H_2 ; $v\downarrow_f^{k''}$
- 2. H_2 ; $v \downarrow_f^{k_1}$ and $k_1 \le k'$. We choose $k'' = k_1$. we get H_2 ; $v \downarrow_f^{k''}$

Derive from the definition, we know: $\exists g_2'' \supseteq G'|_2, H_2', v_1'., H_2; v \downarrow_f^{c_2,k''} H_2'; v_1'(g), H_2' \vDash_{g_2'',k'-k''} Q_2(h), v_1' \in \llbracket A_2 \rrbracket_{g_2'',k'-k''}(i). \ \forall i.g_2'(\gamma_i) = (l_i, A, m) \Rightarrow H_2(l)[n] \neq H_2'(l)[n] \Rightarrow n \in T_i'(**).$

(3),(4) already proved. STS1: $H_1', H_2' \vDash_{G'',k'-k''} \gamma_i \rightarrow \beta_i \cup T_i \cup T_i'$

From (e), we assume: $H_1' = h_1 \uplus h_2 \uplus ... h_n(7), H_2' = h_1' \uplus h_2' \uplus ... h_n'(8)$.

From (*),(**), we know: $\forall i, n.(H_1(l_i)[n] = (H_2(l_i)[n]) \Rightarrow n \notin \beta_i$, otherwise, $n \in \beta_i$.

for all the n not in β_i , if $H_1(l_i)[n] \neq H'_1(l_i)[n]$, then $n \in T_i$. Similarly, if $H_2(l_i)[n] \neq H'_2(l_i)[n]$, then $n \in T'_i$. Unfold the definition of $H'_1, H'_2 \vDash_{G,k} \gamma_i \rightarrow \beta_i \cup T_i \cup T'_i$. $\forall n.H'_1(l_i)[n] \neq H'_2(l_i)[n] \Rightarrow n \in \beta_i \cup T_i \cup T'_i$ because (1) at position n, values differs in H_1, H_2 means n in β_i (2) at position n, value same in H_1, H_2 . and differ in H'_1, H'_2 means n must in T_i or T'_i or both.

This completes the proof of case sub-r-u-monad

Proof of statement (2). Proof is by induction on the subtyping derivation.

$$\frac{\Delta; \Phi \vDash A \sqsubseteq A' \qquad \Delta; \Phi \vDash L' \leq L}{\Delta; \Phi \vDash P \subseteq P' \qquad \Sigma, \vec{\gamma}_1; \Delta; \Phi \vDash Q' \subseteq Q \qquad \vec{\gamma}_1 \subseteq \vec{\gamma}_2} \\ \frac{\exp(L, U)}{\Sigma; \Delta; \Phi \vDash \{P\} \ \exists \vec{\gamma}_1 : A \ \{Q\} \sqsubseteq \{P'\} \ \exists \vec{\gamma}_2 : A' \ \{Q'\}} \\ s-A-monad$$

Pick g,k,v. We assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$, and then we know $: \nu \in \{P\} \exists \vec{\gamma}_1 : A \{Q\} (a)$.

To Show: $v \in \{P'\} \exists \vec{\gamma}_2 : A' \{Q'\} (b)$.

exec(L,U)

By unfolding the definition of $\{P\}$ $\exists \vec{\gamma}_1 : A \{Q\}$, we pick $g' \supseteq g, k' \le k, k'' < k', H$.

Assume $H \vDash_{g',k'} P(1)$, $H; v \downarrow_f^{k''} (2)$. We know: $\exists g'' \supseteq g, H', v_1$, $H; v \downarrow_f^{c_1,k''} H'; v_1(3)$, $H' \vDash_{g'',k'-k''} Q(4)$, $v_1 \in \llbracket A \rrbracket_{g'',k'-k''} (5)$, $P = \gamma_i \to T_i \Rightarrow \forall i.g''(\gamma_i) = (l_i, A, m) \Rightarrow H(l_i)[n] \neq H'(l_i)[n] \Rightarrow n \in T_i(*)$.

Pick g'', H', v_1 . By IH 2 on the first premise $\Delta; \Phi \models A \sqsubseteq A'$ with (5), we know: $v_1 \in [A']_{g'',k'-k''}$ (6).

 $\operatorname{exec}(L',U')$ TS: $v \in \{P'\} \exists \vec{\gamma_2} : A' \{Q'\}$, unfold its definition, we know: $H \vDash_{g',k'} P'$ from (1) and $P \supseteq P'$ because P and P' have the same γ_i . together with (2)

Still To Show: $H; v \Downarrow_f^{c_1,k''} H'; v_1(c), H' \vDash_{g'',k'-k''} Q'(d), v_1 \in [A']_{g'',k'-k''}(e), P' = \gamma_i \to T'_i \Rightarrow \forall i.g'_1(\gamma_i) = T'_i =$ $(l_i, A, m) \Rightarrow H(l_i)[n] \neq H'(l_i)[n] \Rightarrow n \in T'_i(**).$

(c) is proved by assumption (3), (e) is proved by (6), (d) is proved by (4) and $Q' \supseteq Q$, (**) is proved by (*). Because $P \supseteq P' \Rightarrow \forall i.T_i \supseteq T'_i$. For all the n in T_i , it is also in T'_i . This completes the proof of sub-A-

Proof of statement (5). Proof is by induction on the subtyping derivation. We will prove i=1, the proof of i=2 is similar

s-RUM

$$\frac{\operatorname{exec}(L,U)}{\Sigma;\Delta;\Phi\models U\ (\{\gamma_i\to T_i\}\ \exists\vec{\gamma_1'}:A_1\ \{Q_1\},\{\gamma_i\to T_i'\}\ \exists\vec{\gamma_2'}:A_1\ \{Q_2\})\sqsubseteq \{\gamma_i\to\beta_i\}\ \exists\vec{\gamma_1},\vec{\gamma_2}:U(A_1,A_2)\ \{\gamma_i\to\beta_i\cup T_i'\}\ \exists\vec{\gamma_1'}:A_1\ \{Q_2\}\}}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$. we have

$$v \in [|\delta U| (\{\gamma_i \to T_i\} \exists \vec{\gamma}_1 : A_1 \{Q_1\}, \{\gamma_i \to T_i'\} \exists \vec{\gamma}_1 : A_2 \{Q_2\})|_i]|_{|G|_i, k}$$
 (a)

 $\mathsf{TS}: \nu \in \llbracket |\delta \ \{ \gamma_i \to \beta_i \} \ \exists \vec{\gamma_1}, \vec{\gamma_2} : U(A_1, A_2) \ \{ \gamma_i \to \beta_i \cup T_i \cup T_i' \} \ |_i \rrbracket_{|G|_i, k}(b) \ \mathsf{Choose} \ \mathsf{i=1}. \ \mathsf{From} \ \mathsf{(a)}, \ \mathsf{we} \ \mathsf{know} \colon \nu \in \mathsf{MOM}(a) = \mathsf{$
$$\begin{split} & \underset{}{\mathbb{E}} \delta \left\{ \gamma_i \to T_i \right\} \exists \vec{\gamma}_1 : A_1 \left\{ Q_1 \right\}] _{|G|_1,k}(c). \end{split}$$

From (b), Still To Show: $v \in [|\delta \{\gamma_i \to \beta_i\} \exists \vec{\gamma_1}, \vec{\gamma_2} : A_1 \{\gamma_i \to \beta_i \cup T_i \cup T_i'\}]|_{|G|_1, k}(d)$.

Assume $g' \supseteq G|_1, k' \le k, k'' < k'. H \vDash_{g',k'} \gamma_i \to \mathbb{N} (1), H; v \downarrow_f^{k''} (2).$

 $\text{STS: } \exists g'' \supseteq g', H', v', \ H; v \Downarrow_f^{k'', c_1} H'; v'(3), \ H' \vDash_{g'', k' - k''} \gamma_i \xrightarrow{\cdot} \mathbb{N} \ (4), \ v' \in \llbracket A_1 \rrbracket_{g'', k' - k''} \ (5), \ P' = \gamma_i \xrightarrow{\cdot} \mathbb{N} \Rightarrow \mathbb{N}$ $\forall i.g_1'(\gamma_i) = (l_i, A, m) \Rightarrow H(l_i)[n] \neq H'(l_i)[n] \Rightarrow n \in N \ (**).$

From (c), unfold its definition, we know (2) and $H \vDash_{g',k'} \gamma_i \rightarrow T_i$ holds from (1).

Then we get: $\exists g'' \supseteq g', H', v', H; v \downarrow_f^{k'',c_1} H'; v'$ (e), $H' \models_{g'',k'-k''} Q_1(f), v' \in [\![A_1]\!]_{g'',k'-k''}$ (g), $P = \gamma_i \rightarrow [\![A_1]\!]_{g'',k'-k''}$ $T_i \Rightarrow \forall i.g'_1(\gamma_i) = (l_i, A, m) \Rightarrow H(l_i)[n] \neq H'(l_i)[n] \Rightarrow n \in T_i \ (**).$

(3) is proved by (e), (4) is proved by (f) because Q_1 contains at least as many γ_i as its precondition $\gamma_i \to T_i$, (*) is proved by (**) because $T_i \supseteq \mathbb{N}$.

This completes the proof of this case.

$$\frac{\Sigma; \Delta; \Phi \models \tau \sqsubseteq \tau' \qquad \Delta; \Phi \models D \leq D' \qquad \Delta; \Phi \models P' \subseteq P \qquad \Sigma, \vec{\gamma_1} : \vec{\mathbb{L}}; \Delta; \Phi \models Q \subseteq Q' \qquad \Sigma \models \vec{\gamma_1} \sqsubseteq \vec{\gamma_2}}{\Sigma; \Delta; \Phi \models \{P\} \; \exists \vec{\gamma_1} : \tau \; \{Q\} \sqsubseteq \{P'\} \; \exists \vec{\gamma_2} : \tau' \; \{Q'\}} \; \mathbf{s} \cdot \mathbf{RM}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$, we have $v \in [\![\{P\} \ \exists \vec{\gamma_1} : \tau \ \{Q\} \ |_i]\!]_{|G|_i,k}$ (a).

 $\mathsf{TS} \colon v \in [\![|\delta\>\{P'\}\>\exists \vec{\gamma_2} \colon \tau'\>\{Q'\}\>|_i]\!]_{|G|_i,k}(b).$

 $exec(0,\infty)$

Choose i=1. From (a), we know: $v \in [\delta \{|P|_1\}] \exists \vec{\gamma}_1 : |\tau|_1 \{|Q|_1\}]_{|G|_1,k}(c)$.

From (c), Still To Show: $v \in [\delta \{|P'|_1\}] \exists \vec{\gamma_2} : |\tau'|_1 \{|Q'|_1\}]_{|G|_1,k}(d)$

From $P' \supseteq P$ and $Q \supseteq Q'$, we know $|P|_1 = |P'|_1 \land |Q|_1 = |Q'|_1$, it is trivially proved.

This completes the proof of case sub-r-monad.

Theorem 2.1 (Fundamental Theorem).

1. If $\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \leq D : \tau$ and $\vdash \delta : \Delta$ and $\vdash \delta \Phi$ and $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$, then $(\delta \sigma_1 t_1, \delta \sigma_2 t_2) \in (\delta \Gamma)_{G,k}$ $(\delta \tau)_{G,k}^{e}(\delta D)$.

2. If $\Sigma : \Delta : \Phi : \Omega \vdash_L^U t : A \ and \vdash \delta : \Delta \ and \models \delta \Phi \ and \ there \ exists \ \Omega'$. s.t. $FV(t) \subseteq dom(\Omega') \ and \ \Omega' \subseteq \Omega \ and = \delta \Phi \ and \ there \ exists \ \Omega'$. $\sigma \in (\delta\Omega')_{g,k}$, then $(\delta\sigma t) \in [\![\delta A]\!]_{g,k,(\delta L,\delta U)}^e$.

3. If $\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau$ and $\vdash \delta : \Delta$ and $\models \delta \Phi$, then for $i \in \{1,2\}$. if there exists Γ'_i s.t. $FV(t_i)$ $\subseteq dom(\Gamma'_i) \ and \ \Gamma'_i \subseteq \Gamma \ and \ \sigma_i \in [\delta\Gamma'_i|_i]_{G|_i,k}, \ then \ \delta\sigma_i \ t_i \in [\delta\tau_i|]_{G|_i,k,(0,\infty)}^e.$

Corollary 2.1.1. If $\forall k. \bullet \vdash t_1 \ominus t_2 \lesssim n : \tau$, then $(t_1, t_2) \in (\tau)_{G,k,\delta(n)}^e$.

The notation $(\tau)_{G,k,D)}^e$ and $(\tau)_{G,k}^{E,D}$ can be regarded as interchangable. **Proof of statement (1)**. if $\Sigma, \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau$ and $\vdash \delta : \Delta$ and $\models \delta \Phi$ and $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$ then $(t_1\delta\sigma_1, t_2\delta\sigma_2) \in (\delta\tau)_{G,k}^{E,\delta(D)}$.

Proof by induction on typing derivation:

$$\frac{\Sigma; \Delta; \Phi; x: \tau_1, f : \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2, \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau_2}{\Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{Fix} \, f(x). t_1 \ominus \mathsf{Fix} \, f(x). t_2 \lesssim 0 : \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2} \xrightarrow{\mathsf{R-FIX}}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$

TS: $(\delta\sigma_1 \operatorname{fix} f(x).t_1, \delta\sigma_2 \operatorname{fix} f(x).t_2) \in (\delta(\tau_1 \xrightarrow{\operatorname{diff}(D)} \tau_2))_{G,k}^{E,0}$ By unfolding the definition and the fact that $\operatorname{fix} f(x).t_1$ and $\operatorname{fix} f(x).t_2$ are values

STS: $(\delta \sigma_1 \operatorname{fix} f(x).t_1, \delta \sigma_2 \operatorname{fix} f(x).t_2) \in (\delta \tau_1 \longrightarrow \delta \tau_2)_{G,k}$

Set $F = \delta \sigma_1$ fix $f(x) \cdot t_1, F' = \delta \sigma_2$ fix $f(x) \cdot t_2$, We want to prove a general statement: $\forall m \leq k \cdot (F, F') \in (\delta \tau_1 \longrightarrow \delta \tau_2)_{G,m}$. By sub-induction on m, there are two cases to show.

subcase 1: m=0, we unfold the definition of function type interpretation, there are two parts to show:

subsubcase 1: $\forall k' < m.(v_1, v_2) \in (\tau_1)_{G,k'} \Rightarrow \dots$ It is vacuous by definition to show $k' \leq -1$.

$$\textbf{subsubcase 2:} \ \ \mathsf{STS:} \ \forall \ j.F \in [\![|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1]\!]_{G|_1,j} \land F' \in [\![|\delta\tau_1|_2 \longrightarrow |\delta\tau_2|_2]\!]_{G|_2,j}. \\ \mathsf{Pick} \ j.$$

1. STS 1: $F \in [|\delta \tau_1|_1 \xrightarrow{\expc(0,\infty)} |\delta \tau_2|_1]]_{G|_1,j}$, we prove the more general statement.

$$\forall m' \leq j.F \in [|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1]|_{G|_1,m'}$$

$$\tag{2.1}$$

By subinduction on m', there are two csases:

1.1. m'=0, we unfold the definition of $\|\delta\tau_1\|_1 \longrightarrow \|\delta\tau_2\|_1\|_{G_{1},m'}$, there is no non-negative k' < m'(0), it is vacuously true.

1.2. m'=m"+1. By sub-IH on m"

$$F \in [\![|\delta\tau_1|\!]_1 \xrightarrow{\operatorname{exec}(0,\infty)} |\delta\tau_2|\!]_1]\!]_{G|_1,m''} \tag{2.2}$$

 $\text{STS: } F \in [\![|\delta\tau_1|\!]_1 \overset{\text{exec}(0,\infty)}{\longrightarrow} |\delta\tau_2|\!]_1]\!]_{G|_1,m'}$

Unfold the definition of $[\![|\delta\tau_1|]_1,m]$ $\underset{\exp c(0,\infty)}{\operatorname{exec}(0,\infty)}$

Pick j'' < m'' + 1, $g' \supseteq G|_1$ and assume that $v \in [\![|\delta \tau_1|_1]\!]_{g',j''}$.

STS: $\delta \sigma_1 t_1[v/x]$ [fix $f(x).t_1/f$] $\in [|\tau_2|_1]_{g',j''}^{E,(0,\infty)}$

This follows by IH 3 on the premise instantiated with

 $\sigma_1[v/x][\mathsf{fix}\,f(x).t_1/f] \in \llbracket \delta(x:|\tau_1|_1,f:|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1,|\Gamma_1|) \rrbracket_{g',j''} \text{ which holds because}$

- i. $FV(t_1) \subseteq dom(x:\tau_1, f:\tau_1 \xrightarrow{diff(D)} \tau_2, \Gamma)$ using Lemma 5.
- ii. $\sigma_1 \in [\![\delta\Gamma]_1]\!]_{\sigma',j''}$ by Lemma 6 and then Lemma 1.
- iii. $v \in [|\delta \tau_1|_1]|_{g',j''}$ from the assumption.
- $\text{iv. } F \in [\![|\delta\tau_1|]_1 \overset{\text{exec}(0,\infty)}{\longrightarrow} |\delta\tau_2|_1]\!]_{g',j''} \text{ by Lemma } 1 \text{ on } (3.2).$
- 2. STS 2: $F' \in [|\delta \tau_1|_2 \xrightarrow{\expc(0,\infty)} |\delta \tau_2|_2]|_{G|_2,j}$ Its proof is similar with STS 1.

subcase 2: $m = m' + 1 \le k$

By the definition of function types, there are two parts to show:

subsubcase 1: $\forall k' < m.(v_1, v_2) \in (\tau_1)_{G,k} \Rightarrow \dots$

Assume $G' \supseteq G, k' \le (m-1)$. Pick v_1, v_2 s.t. $(v_1, v_2) \in (\delta \tau_1)_{G', k'}$.

Assume $G \supseteq G, K \subseteq (M-1)$. First v_1, v_2 s.t. $(v_1, v_2) \in \{0, t_1\}_{G', K'}$.

STS: $(t_1[v_1/x][\text{fix } f(x).t_1/f], t_2[v_2/x][\text{fix } f(x).t_2/f]) \in \{0, t_1\}_{G', K'}$ By IH on premise instantiated with $\sigma'_1 = \sigma_1[v_1/x][\text{fix } f(x).t_1/f], \sigma'_2 = \sigma_2[v_2/x][\text{fix } f(x).t_2/f]$

and $(\sigma_1', \sigma_2') \in \{(\Gamma, x : \tau, f : \tau_1 \xrightarrow{\text{diff}(D)} \tau_2) \delta\}_{G', k'}$ which holds because

- 1. $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k'}$ by assumption and Lemma 1.
- 2. $(v_1, v_2) \in (\tau)_{G', k'}$ from assumption
- 3. $(F_1,F_2) \in (\delta(\tau_1 \to \tau_2))_{G',k'}$ from sub-IH $(F_1,F_2) \in (\delta(\tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2))_{G,m'}$ and Lemma 1 $(k' < \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2)$

subsubcase 2:
$$\forall j.F \in [\![|\delta\tau_1|\!]_1] \longrightarrow |\delta\tau_2|\!]_1 [\![]_{G|_1,j} \land F' \in [\![|\delta\tau_1|\!]_2] \longrightarrow |\delta\tau_2|\!]_2 [\![]_{G|_2,j}$$
 which is already proved above

This completes the proof of this case.

$$\text{CASE} \ \frac{ \substack{\Sigma; \Delta; \Phi; x : \tau_1, f : \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2, \Gamma, f : U(A_1, A_2) \vdash t_1 \ominus t_2 \lesssim D : \tau_2 \\ \frac{\Sigma; \Delta; \Phi; |\Gamma|_1 \vdash_0^0 \operatorname{Fix} f(x). t_1 : A_1 \qquad \Sigma; \Delta; \Phi; |\Gamma|_2 \vdash_0^0 \operatorname{Fix} f(x). t_2 : A_2}{\Sigma; \Delta; \Phi; \Gamma \vdash \operatorname{Fix} f(x). t_1 \ominus \operatorname{Fix} f(x). t_2 \lesssim 0 : \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2}} \, \underset{\text{R-FIX-EXT}}{\overset{\text{R-FIX-EXT}}{\longrightarrow}}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\![\delta \Gamma]\!]_{G,k}$.

To Show (fix f(x). $t_1\delta\sigma_1$, fix f(x). $t_2\delta\sigma_2$) $\in \langle \delta(\tau_1 \xrightarrow{\text{diff}(D)} \tau_2) \rangle_{G,k}^{E,0}$. By unfolding the definition and the fact that fix f(x). t_1 and fix f(x). t_2 are values

STS: $(\text{fix } f(x).t_1\delta\sigma_1, \text{fix } f(x).t_2\delta\sigma_2) \in (\delta\tau_1 \longrightarrow \delta\tau_2)_{G,k}$, we set $F = \text{fix } f(x).t_1\delta\sigma_1, F' = \text{fix } f(x).t_2\delta\sigma_2$, We want to prove a general statement.

 $\operatorname{diff}((\delta D))$ $\forall\,m\leq k.\,(F,F')\in \big(\!\!\big|\delta\tau_1\stackrel{\textstyle \sim}{\longrightarrow} \tilde{\delta}\tau_2\big)\!\!\big|_{G,m}$

By sub-induction on m, there are two cases to show.

subcase 1: m=0. Unfold the definition of function type interpretation, there are two parts to show:

subsubcase 1: $\forall k' < m.(v_1, v_2) \in (\tau_1)_{G,k'} \Rightarrow \dots$ It is vacuous by definition to show $k' \leq -1$.

$$\textbf{subsubcase 2:} \ \ \mathsf{STS:} \ \forall j.F \in [\![|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1]\!]_{G|_1,j} \land F' \in [\![|\delta\tau_1|_2 \longrightarrow |\delta\tau_2|_2]\!]_{G|_2,j}. \\ \mathsf{Pick} \ j.$$

1. STS 1: $F \in [|\delta \tau_1|_1 \xrightarrow{\expc(0,\infty)} |\delta \tau_2|_1]]_{G|_1,j}$. We prove the more general statement

$$\forall m' \le j.F \in [|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1]|_{G|_1,m'}$$
(2.3)

By subinduction on m', there are two csases:

- 1.1. m'=0. Unfold the definition of $[\![|\delta \tau_1|]_1 \longrightarrow |\delta \tau_2|_1]\!]_{G|_1,m'}$, there is no non-negative k' < 10(m'), it is vacuously true.
- 1.2. m'=m"+1. By sub-IH on m'."

$$F \in [\![|\delta\tau_1|\!]_1 \longrightarrow |\delta\tau_2|\!]_1]\!]_{G|_1,m''} \tag{2.4}$$

 $\text{STS: } F \in [\![|\delta\tau_1|]_1 \stackrel{\mathrm{exec}(0,\infty)}{\longrightarrow} |\delta\tau_2|_1]\!]_{G|_1,m'}$

Unfold the definition of $\|\delta \tau_1\|_1 \longrightarrow |\delta \tau_2|_1 \|_{G|_1,m''+1}$.

Pick j'' < m'' + 1, $g' \supseteq G|_1$ and assume that $v \in [\![|\delta \tau_1|_1]\!]_{g',j''}$.

STS: $\delta \sigma_1 t_1 [v/x] [\operatorname{fix} f(x).t_1/f] \in [|\tau_2|_1]_{g',j''}^{E,(0,\infty)}$

This follows by IH 3 on the premise instantiated with

$$\begin{split} &\sigma_1[v/x][\operatorname{fix} f(x).t_1/f] \in [\![\delta|(x:\tau_1,f:\!\delta\tau_1 \longrightarrow \delta\tau_2,f:U(A_1,A_2),\Gamma_1)|_1]\!]_{g',j''} \Rightarrow \\ &\sigma_1[v/x][\operatorname{fix} f(x).t_1/f] \in [\![\delta(x:|\tau_1|_1,f:A_1,|\Gamma_1|_1)]\!]_{g',j''} \text{ which holds because} \end{split}$$

- i. $FV(t_1) \subseteq dom(x:\tau_1,f:\tau_1 \xrightarrow{\text{diff}(D)} \tau_2,f:U(A_1,A_2),\Gamma)$ using Lemma 5.
- ii. $\sigma_1 \in [\![\delta\Gamma]_1]\!]_{g',j''}$ by Lemma 6 and then Lemma 1.
- iii. $v \in [\![|\delta \tau_1|_1]\!]_{g',j''}$ from assumption.
- iv. $F \in [\![\delta A_1]\!]_{g',j''}$ by IH2 on the second premise of FIX-EXT instantiated with $\Omega' =$ $|\Gamma|_1$ to show $F \in [\![\delta A_1]\!]_{G|_1,k}$. Then use Lemma 1.
- 2. STS 2: $F' \in [|\delta \tau_1|_2 \longrightarrow |\delta \tau_2|_2]|_{G|_2,j}$ Its proof is similar with STS 1.

subcase 2: $m = m' + 1 \le k$. By the definition of function types, there are two parts to show:

subsubcase 1: $\forall k' < m.(v_1, v_2) \in (\tau_1)_{G,k} \Rightarrow \dots$

Assume G' ⊇ G, k' ≤ (m-1). Pick v_1, v_2 s.t. $(v_1, v_2) ∈ (δτ_1)_{G',k'}$.

STS: $(t_1[v_1/x][\text{fix } f(x).t_1/f], t_2[v_2/x][\text{fix } f(x).t_2/f]) \in (\delta \tau_2)_{G',k'}^{E,(\delta D)}$ By IH on premise instantiated with $\sigma'_1 = \sigma_1[v_1/x][\text{fix } f(x).t_1/f], \sigma'_2 = \sigma_2[v_2/x][\text{fix } f(x).t_2/f]$

and $(\sigma'_1, \sigma'_2) \in ((\Gamma, x : \tau, f : \tau_1 \xrightarrow{\text{diff}(D)} \tau_2, f : U(A_1, A_2))\delta)_{G', k'}$ which holds because

- 1. $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k'}$ by assumption and Lemma 1.
- 2. $(v_1, v_2) \in (\tau)_{G', k'}$ from assumption
- 3. $(F_1,F_2) \in (\delta(\tau_1 \to \tau_2))_{G',k'}$ from sub-IH $(F_1,F_2) \in (\delta(\tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2))_{G,m'}$ and Lemma 1 $(k' < \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2)$
- 4. $(F_1, F_2) \in \{U(A_1, A_2)\}_{G', k}$. STS: $\forall n, i \in \{1, 2\}. F_i \in \{A_i\}_{G|_i, n}$. By Lemma 6, we know $\forall k. \sigma_i \in \{1, 2\}. F_i \in \{A_i\}_{G|_i, n}$. $(\delta |\Gamma|_i)_{g,k}$, it is proved by IH2 on the second and third premises respectively.

 $\begin{array}{c} \operatorname{exec}(0,\infty) \\ \operatorname{subsubcase 2:} \ \, \forall \, j.F \in [\![|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1]\!]_{G|_1,j} \wedge F' \in [\![|\delta\tau_1|_2 \longrightarrow |\delta\tau_2|_2]\!]_{G|_2,j} \end{array}$ which is already proved above

This proof is the same as case Fix.

$$\begin{aligned} \textbf{Case} & \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \text{int}[I] \qquad \Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \tau \qquad \gamma \text{ fresh} \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi; \Gamma \vdash \text{alloc } t_1 \ t_2 \ominus \text{alloc } t_1' \ t_2' \lesssim 0 : \{P\} \ \exists \gamma. \ \mathsf{Array}_{\gamma}[I] \ \tau \ \{P \star \gamma \to \mathbb{N}\} \end{aligned} \mathbf{r-alloc}$$

By assumption we have $\vdash \delta : \Delta, \models \delta \Phi$ and $(\sigma_1, \sigma_2) \in [\![\delta \Gamma]\!]_{G,k}$, we need to show:

$$(\mathsf{alloc}(\delta\,\sigma_1\,t_1)\,(\delta\,\sigma_1\,t_2),\mathsf{alloc}\,(\delta\,\sigma_2\,t_1')\,(\delta\,\sigma_2\,t_2')) \in \big(\![\{P\}\,\exists\vec{\gamma}.\,\mathsf{Array}_{\gamma}[I]\,\delta\tau\,\{P\star\gamma\to\mathbb{N}\}\!]\big)_{G,k,0}^e$$

Since alloc $(\delta \sigma_1 t_1)$ $(\delta \sigma_1 t_2)$ and alloc $(\delta \sigma_2 t_1')$ $(\delta \sigma_2 t_2')$ are values, it is sufficient to show:

$$(\mathsf{alloc}\,(\delta\,\sigma_1\,t_1)\,(\delta\,\sigma_1\,t_2),\mathsf{alloc}\,(\delta\,\sigma_2\,t_1')\,(\delta\,\sigma_2\,t_2')) \in \big(\![\{P\}\,\exists\gamma.\,\mathsf{Array}_\gamma[I]\,(\delta\,\tau)\,\{P\star\gamma\to\mathbb{N}\}\big)\!|_{G,k}$$

Unfold its definition, when we are given arbitrary $G' \supseteq G$, $k' \le k$, and heaps H_1 , H_2 and assume $(H_1, H_2) \vDash_{G', k'} P$. Suppose the evaluation of alloc $(\delta \sigma_1 t_1)$ $(\delta \sigma_1 t_2)$ and alloc $(\delta \sigma_2 t'_1)$ $(\delta \sigma_2 t'_2)$ of the following form:

$$\frac{\delta\,\sigma_1\,t_1\,\!\!\!\!\downarrow^{c_1,k_1}\,n\quad\delta\,\sigma_1\,t_2\,\!\!\!\downarrow^{c_2,k_2}\,\nu\quad z=\overbrace{[\nu,\ldots,\nu]}^n\quad l\;\mathrm{fresh}}{\mathsf{alloc}\,(\delta\,\sigma_1\,t_1)\,(\delta\,\sigma_1\,t_2);H_1\,\!\!\!\!\downarrow^{c_1+c_2+c_{\mathsf{alloc}},k_1+k_2+1}_fl;H_1\uplus[l\to z]}\;\mathbf{f\text{-alloc}}$$

$$\frac{\delta \, \sigma_2 \, t_1' \, \Downarrow^{c_1',k_1'} \, n' \quad \delta \, \sigma_2 \, t_2' \, \Downarrow^{c_2,k_2} \, v' \quad z' = \overbrace{[v',\ldots,v']}^{n'} \quad l' \text{ fresh}}{\text{alloc} \, (\delta \, \sigma_2 \, t_1') \, (\delta \, \sigma_2 \, t_2'); H_2 \, \Downarrow^{c_1'+c_2'+c_{\text{alloc}},k_1'+k_2'+1} \, l'; H_2 \uplus [l \to z']} \, \mathbf{f\text{-alloc}}$$

, with $k_1+k_2+1 < k' \le k$. Now taking $G_2 = G'[r \to (l,l',\delta\tau,\delta I)$, $H_1' = H_1 \uplus [l \to z]$ and $H_2' = H_2 \uplus [l' \to z']$, we must show that

- 1. $(H'_1, H'_2) \vDash_{G_2, k' (k_1 + k_2 + 1)} P \star \gamma \to \mathbb{N}$
- 2. $(l, l') \in (Array_{\gamma}[\delta I] (\delta \tau))_{G_2, k'-(k_1+k_2+1)}$.
- 3. $(c_1 + c_2 + c_{\text{alloc}}) (c'_1 + c'_2 + c_{\text{alloc}}) \le (\delta D_1 + \delta D_2)$.

By induction hypothesis on the first premise $\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \text{int}[I]$, we conclude:

$$(\delta \sigma_1 t_1, \delta \sigma_2 t_1') \in \{\inf_r [\delta I]\}_{G', k', \delta D_1}^e$$

, which we unwind to conclude that: $(n, n') \in (\inf_r [\delta I])_{G', k'-k_1}$, which in turn tells us that

$$n = n' = \delta I \wedge c_1 - c_1' \leq \delta D_1$$

By induction hypothesis on the second premise Σ ; Δ ; Φ ; $\Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \tau$, we conclude that:

$$(\delta \sigma_1 t_2, \delta \sigma_2 t_2') \in (\delta \tau)_{G', k', \delta D_2}^e$$

, which we unfold to conclude that

$$(v, v') \in (\delta \tau)_{G' k' - k_2} \land c_2 - c_2' \le \delta D_2$$

We can now conclude that:

1. $(H'_1, H'_2) \vDash_{G_2, k' - (k_1 + k_2 + 1)} P \star \gamma \to \mathbb{N}$. When $\gamma_i \neq \gamma$, the corresponding arrays is not changed, it is true from our assumption $(H_1, H_2) \vDash_{G', k'} P$. When $\gamma_i = \gamma$, we can show that $\forall i < \delta I.H'_1(l)[i] \neq H'_2(l')[i] \Rightarrow i \in \mathbb{N}$.

- 2. $(l, l') \in (Array_{\gamma}[\delta I] (\delta \tau))_{G_2, k'-(k_1+k_2+1)}$. It is proved by the its definition using $G_2 = G'[r \to (l, l', \delta \tau, \delta I)]$.
- 3. $(c_1 + c_2 + c_{\text{alloc}}) (c_1' + c_2' + c_{\text{alloc}}) \le (\delta D_1 + \delta D_2)$. It is proved by the previous conclusions.

This proof is complete.

$$\begin{split} & \Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathrm{int}[I] \\ & \Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \Box \tau \qquad \gamma \text{ fresh } \qquad \Sigma; \Delta \vdash P \quad wf \\ & \Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{alloc} \ t_1 \ t_2 \ominus \mathsf{alloc} \ t_1' \ t_2' \lesssim 0 : \{P\} \ \exists \gamma. \ \mathsf{Array}_{\gamma}[I] \ \Box \tau \ \{P \star \gamma \to \emptyset\} \end{split}$$
 R-ALLOCB

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\!\!| \delta \Gamma |\!\!|)_{G,k}$ TS: $(\!\!| \delta \sigma_1(\mathsf{alloc}\, t_1\, t_2), (\delta \sigma_2(\mathsf{alloc}\, t_1'\, t_2')\!\!|) \in (\!\!| \delta (\{P\}\, \exists \vec{\gamma}.\, \mathsf{Array}_{\gamma}[I]\, \tau\, \{P \star \gamma \to \emptyset\})) \!\!|_{G,k}^{E,0}$ By unfolding the definition of $\{\tau\}_{G}^{E}$

STS: $\left(\delta\sigma_1(\mathsf{alloc}\,t_1\,t_2), (\delta\sigma_2(\mathsf{alloc}\,t_1'\,t_2')\right) \in \left(\delta(\{P\}\,\exists\gamma.\,\mathsf{Array}_{\gamma}[I]\,\tau\,\{P\star\gamma\to\emptyset\})\right)_{G,k}$

Unfold the definition of $\{\delta\}$ $\{P\}$ $\exists \gamma$. Array $_{\gamma}[I]$ τ $\{P \star \gamma \to \emptyset\}\}$ $_{G,k}$.

Pick $G^{'} \supseteq G$, H_1 , H_2 , $k' \le k$, k'' < k', k'''. Assume $\delta \sigma_1(\text{alloc } t_1 \ t_2)$; $H_1 \Downarrow_f^{k''}$ (1), $\delta \sigma_2(\text{alloc } t_1' \ t_2')$; $H_2 \Downarrow_f^{k'''}$ (2). Because t_1, t_2 are sub terms of $\delta \sigma$ alloc t_1 t_2 , t_1', t_2' are sub terms of $\delta \sigma$ alloc t_1' t_2' . From (1)(2), we get: $\delta\sigma_1 t_1 \Downarrow_f^{k_1} \wedge \delta\sigma_1 t_2 \Downarrow_f^{k_2} (3), \delta\sigma_2 t_1' \Downarrow_f \wedge \delta\sigma_2 t_2' \Downarrow_f (4).$

From (3),(4), we get: $\exists v_1, v_2, k_1, k_2.\delta\sigma_1 t_1 \Downarrow^{k_1,c_1} v_1 \wedge \delta\sigma_1 t_2 \Downarrow^{k_2,c_2} v_2 \wedge k'' = k_1 + k_2 + 1 \wedge c = c_1 + c_2 + c_{alloc}$ (a) $\exists v_1', v_2'.k_1', k_2'.\delta\sigma_2 t_1' \Downarrow^{k_1',c_1'} v_1' \wedge \delta\sigma_2 t_2' \Downarrow^{k_2',c_2'} v_2' \wedge k''' = k_1' + k_2' + 1 \wedge c' = c_1' + c_2' + c_{alloc}$ (b) From (a),(b) and evaluation rules we get:

$$\exists l. (\mathsf{alloc}\, t_1\, t_2) \delta\sigma; H_1 \biguplus_f^{k'',c} l; H_1, l \to [v_2, \dots v_2] \tag{c}$$

$$\exists l'. (\mathsf{alloc}\ t_1'\ t_2') \delta\sigma; H_2 \Downarrow_f^{c'} l'; H_2, l' \to [\nu_2', \dots \nu_2'] \tag{d}$$

By IH on the first premise instantiated with $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k''}$ using lemma 1, we get:

$$(\delta\sigma_1 t_1, \delta\sigma_2 t_1') \in \left(\inf_{\Gamma[I]}\right)_{G', k''}^{E, \delta D_1} \tag{*}$$

Unfold the definition of $\{\inf_r[I]\}_{G',k''}^E$ and using (a) and $k_1 \le k''$, we know:

$$(v_1, v_1') \in \{\inf_r[I]\}_{G', k'' - k_1} \Rightarrow v_1 = v_1' = I \land c_1 - c_1' \le \delta D_1$$
 ih1

By IH on the second premise instantiated with $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k'-k_1}$ using lemma 1, we get:

$$(\delta\sigma_1 t_2, \delta\sigma_2 t_2') \in (\tau)_{G', k'-k_1}^{E, \delta D_2} \tag{**}$$

Unfold the definition of (**) and using (a), (b) and $k_2 \le k' - k_1$, we know

$$(v_2, v_2') \in (\Box \tau)_{G', k'-k_1-k_2} = (\Box \tau)_{G', k'-k''+1} \land c_2 - c_2' \le \delta D_2 \Rightarrow v_2 = v_2'$$
 ih2

Let us assume: $G'' = G'[r \rightarrow (l, l', \tau, I)]$ (e), $H'_1 = H_1, l \rightarrow [v_2, v_2, ..., v_2](f)$, $H'_2 = H_2, l' \rightarrow [v'_2, v'_2, ..., v'_2](g)$. we want to show 3 cases.

TS1 $(l, l') \in (Array_{\gamma}[I] \tau)_{G'', k'-k''}$ it is proved by unfolding the definition and using the assumption (e).

TS2
$$(H'_1, H'_2) \vDash_{G'', k' - k''} P \star \gamma \to \emptyset$$

 $G''(\gamma) = (l, l', \tau, I), H''_1 = l \to [\nu_2, \nu_2, ..., \nu_2], H''_2 = l' \to [\nu'_2, \nu'_2, ..., \nu'_2]$

STS1 $\forall i \leq I, (H_1''(l)[i], H_2''(l')[i]) \in (\tau)_{G'', k'-k''-1}$ It is proved by using ih2 and Lemma 1.

STS2 $\forall i \leq I, H'_1(l)[i] \neq H''_2(l')[i] \to i \in \emptyset$

We know that $\forall i \leq I.H_1(l)[i] = v_2, H_1'(l')[i] = v_2'$ and $v_2 = v_2'$ from ih2. We can not find any i that make $H_1'(l)[i] \neq H_2''(l')[i]$ hold. It is proved.

TS3 $c - c' \le \delta(D_1 + D_2)$ from ih1 and ih2.

This proof is complete.

$$Case \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \tau_1^{\mathrm{diff}((D))}}{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 t_2 \ominus t_1' \lesssim D + D_1 + D_2 : \tau_2} \quad \mathbf{r}\text{-app}$$

By assumption we have $\vdash \delta : \Delta, \models \delta \Phi$ and $(\sigma_1, \sigma_2) \in [\![\delta \Gamma]\!]_{G,k}$, we need to show:

$$\left((\delta \sigma_1 t_1) (\delta \sigma_1 t_2), (\delta \sigma_2 t_1') (\delta \sigma_2 t_2') \right) \in (\![\delta \tau_2]\!]_{G,k,(\delta D + \delta D_1 + \delta D_2)}^e$$

Unfold the definition, suppose the evaluation of $(\delta \sigma_1 t_1)(\delta \sigma_1 t_2)$ and $(\delta \sigma_2 t_1')(\delta \sigma_2 t_2')$ of the following form:

$$\frac{\delta \sigma_1 \, t_1 \, \Downarrow^{c_1,k_1} \, \mathrm{fix} \, f(x).t \quad \delta \, \sigma_1 \, t_2 \, \Downarrow^{c_2,k_2} \, v \quad t[\mathrm{fix} \, f(x).t/f][v/x] \, \Downarrow^{c_3,k_3} \, v_1}{(\delta \, \sigma_1 \, t_1) \, (\delta \, \sigma_1 \, t_2) \, \Downarrow^{c_1+c_2+c_3+c_{\mathsf{fapp}},k_1+k_2+k_3+1} \, v_1} \, \mathbf{e}\text{-}\mathbf{fix}} \\ \frac{\delta \, \sigma_1 \, t_1' \, \Downarrow^{c_1',k_1'} \, \mathrm{fix} \, f(x).t' \quad \delta \, \sigma_1 \, t_2' \, \Downarrow^{c_2',k_2'} \, v' \quad t'[\mathrm{fix} \, f(x).t'/f][v'/x] \, \Downarrow^{c_3',k_3'} \, v_1'}{(\delta \, \sigma_2 \, t_1') \, (\delta \, \sigma_2 \, t_2') \, \Downarrow^{c_1'+c_2'+c_3'+c_{\mathsf{fapp}},k_1'+k_2'+k_3'+1} \, v_1'} \, \mathbf{e}\text{-}\mathbf{fix}}$$

we must show that:

- 1. $(v_1, v_1') \in (\delta \tau_2)_{G, k (k_1 + k_2 + k_3 + 1)}$.
- 2. $(c_1 + c_2 + c_3 + c_{\mathsf{fapp}}) (c_1' + c_2' + c_3' + c_{\mathsf{fapp}}) \le \delta D + \delta D_1 + \delta D_2$

By induction hypothesis on the first premise $\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim D_1 : \tau_1^{\text{diff}((D))} \xrightarrow{} \tau_2$, instantiated with $(\sigma_1, \sigma_2) \in \llbracket \delta \Gamma \rrbracket_{G,k}$ and the index variable substitution δ . We conclude that:

$$(\delta \, \sigma_1 \, t_1, \delta \, \sigma_2 \, t_1') \in (\![\delta \tau_1 \longrightarrow \delta \tau_2]\!]_{G,k,\delta \, D_1}^e$$

, which we unfold to conclude that

$$(\mathsf{fix}\, f(x).t, \mathsf{fix}\, f(x).t') \in (\![\delta \sigma_1]^{\mathsf{diff}((\delta D))}_{\tau_1} \longrightarrow \delta \tau_2)\!]_{G,k-k_1} \ \land \ c_1 - c_1' \le \delta \, D_1$$

By induction hypothesis on the second premise Σ ; Δ ; Φ ; $\Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \tau_1$, we conclude that:

$$(\delta \sigma_1 t_2, \delta \sigma_2 t_2') \in (\delta \tau_1)_{G,k,\delta D_2}^e$$

, which we unwind to conclude that

$$(v, v') \in (\delta \tau_1)_{G,k-k_2} \wedge c_2 - c_2' \leq \delta D_2$$

We unfold $(\text{fix } f(x).t, \text{fix } f(x).t') \in (\delta \tau_1 \longrightarrow \delta \tau_2)_{G,k-k_1}$, when we choose G' = G and $k' = k - (k_1 + k_2 + 1) \leq k - k_1 - 1$, we know that $(v, v') \in (\delta \tau_1)_{G,k-(k_2+k_1+1)}$, we conclude that

$$(t[\text{fix}\,f(x).t/f][v/x],t'[\text{fix}\,f(x).t'/f][v'/x]) \in (\delta \tau_2)_{G,k-(k_1+k_2+1),\delta D}^e$$

, which we unwind to conclude that

$$(v_1, v_1') \in (\delta \tau_2)_{G,k-(k_1+k_2+k_3+1),\delta D} \land c_3 - c_3' \le \delta D$$

Now we can conclude as follows:

- 1. $(v_1, v_1') \in (\delta \tau_2)_{G,k-(k_1+k_2+k_3+1)}$. It is already shown.
- 2. $(c_1 + c_2 + c_3 + c_{\mathsf{fapp}}) (c_1' + c_2' + c_3' + c_{\mathsf{fapp}}) \le \delta D + \delta D_1 + \delta D_2$. It is proved by our aforementioned

This completes the proof of case r-app.

$$\text{CASE} \frac{ \Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau}{ \Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathsf{int}[I'] \qquad \Delta \models I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf}{ \Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1' \ t_2' \lesssim 0 : \{P \star \gamma \to \beta\} \ \exists_.\tau \ \{P \star \gamma \to \beta\} } \overset{\mathsf{diff}(D_1 + D_2)}{ R - \mathsf{R}}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\![\delta \Gamma]\!]_{G,k}$

TS: $(\delta\sigma_1(\text{read }t_1\ t_2), \delta\sigma_2(\text{read }t_1'\ t_2')) \in (\delta\{P\star\gamma\to\beta\}\ \exists_{-\tau}\{P\star\gamma\to\beta\})_{G,k}^{E,0}$ Because read t_1 t_2 is a value.

STS: $(\delta \sigma_1(\text{read }t_1\ t_2), \delta \sigma_2(\text{read }t_1'\ t_2')) \in \{\!\!\{\delta \{P \star \gamma \to \beta\}\}\}\!\!\}_{G,k}$

Unfold the definition of $\{\delta P \star \gamma \to \beta\} \exists_{-\tau} \{P \star \gamma \to \beta\} \}_{G,k}$. Pick $G' \supseteq G$, H_1 , $H_2, k' \le k$, k'' < k', k'''. Assume $(H_1, H_2) \vDash_{G',k'} P \star \gamma \to \beta$ (1), $\delta \sigma_1$ (read $t_1 \ t_2$); $H_1 \ \downarrow_f^{k''}$ (2), $\delta\sigma_2(\text{read }t_1'\ t_2'); H_2 \downarrow_f^{k''}$ (3).

Because t_1, t_2 are sub terms of read t_1 t_2 , t_1', t_2' are sub terms of read t_1' t_2' . From (2)(3), we get: $\delta \sigma_1 t_1 \downarrow_f^{k_1}$ $\wedge \delta \sigma_1 t_2 \Downarrow_f^{k_2} (4), \delta \sigma_2 t_1' \Downarrow_f^{k_1'} \wedge \delta \sigma_2 t_2' \Downarrow_f^{k_2'} (5).$

From (4),(5), we get: $\exists l, n, k_1, k_2.\delta\sigma_1 t_1 \Downarrow^{k_1, c_1} l \wedge \delta\sigma_1 t_2 \Downarrow^{k_2, c'_1} n \wedge k'' = k_1 + k_2 + 1 \wedge c = c_1 + c'_1 + c_{read}$ (a). $\exists l', n', k'_1, k'_2. \delta\sigma_2 t'_1 \Downarrow^{k'_1, c_2} l' \wedge \delta\sigma_2 t'_2 \Downarrow^{k'_2, c'_2} n' \wedge k''' = k'_1 + k'_2 + 1 \wedge c' = c_2 + c'_2 + c_{read} \ (b)$

From (a),(b) and the evaluation rule we get: $\exists v. \delta \sigma_1 \text{ (read } t_1 \ t_2); H_1 \ \psi_f^{k'',c} \ v; H_1 \land H_1(l)[n] = v \ (c)$

 $\exists v'.\delta\sigma_2(\mathsf{read}\ t_1'\ t_2'); H_2 \Downarrow_f^{k''',c'} v'; H_2 \land H_2(l')[n'] = v'\ (d)$

By IH on the first premise instantiated with $(\sigma_1, \sigma_2) \in (\delta\Gamma)_{G', k'}$ by lemma 1. we get:

$$(\delta\sigma_1 t_1, \delta\sigma_2 t_1') \in (Array_{\gamma}[I] \delta\tau)_{G', k'}^{E, D_1}$$
 (6)

Unfold (6), since $k_1 \le k'$ and $\delta \sigma_1 t_1 \Downarrow^{k_1} l$ and $\delta \sigma_2 t_1' \Downarrow l'$, we know

$$(l, l') \in (Array_{\gamma}[I] \delta \tau)_{G', k'-k_1} \wedge c_1 - c_2 \le \delta D_1$$
 (e)

From (e), we know : $G'(\gamma) = (l, l', \tau, I)$ (7).

By IH on the second premise instantiated with $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k'}$ by lemma 1. we get:

$$(\delta \sigma_1 t_2, \delta \sigma_2 t_2') \in (\delta \operatorname{int}_r [I'])_{G', k'}^E$$
(8)

Unfold (8), since $k_2 \le k'$, we know $(n, n') \in \{\inf_r [I']\}_{G', k' - k_2} \Rightarrow n = n' = I' \land c'_1 - c'_2 \le \delta D_2(f)$. Let us assume: G' = G'(g).

STS1: $(H_1, H_2) \models_{G', k'-k''} P \star \gamma \rightarrow \beta$. By Lemma 7 and (1), this is proved.

STS2: $(v, v') \in (\tau)_{G', k'-k''}$. From (c),(d). we know $H_1(l)[n] = v$ and $H_2(l')[n'] = v'$. based on (e) and (f), unfold (1), we know: $\forall i \leq n, (H_1(l)(i), H_2(l')(i)) \in \{\tau\}_{G',k'-1}$ s.t we know $(H_1(l)[n], H_2(l')[n']) \in \{\tau\}_{G',k'-1}$ $\|\tau\|_{G',k'-1}$. Because $k'-k'' \le k'-1$, By Lemma 1, We get: $(v,v') \in \|\tau\|_{G',k'-k''}$

STS3: $c - c' \le \delta(D_1 + D_2)$, which is proved by (e),(f).

This completes the proof of case read.

$$\begin{array}{c} \Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \\ \\ \mathsf{CASE} \ \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathsf{int}[I'] \qquad \Sigma; \Delta \models I' \leq I \qquad \Sigma; \Delta; \Phi \models I' \not\in \beta \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1' \ t_2' \lesssim 0 : \{P \star \gamma \to \beta\} \ \exists_. \Box \tau \ \{P \star \gamma \to \beta\} } \end{array}_{\mathsf{R-RB}}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\![\delta \Gamma]\!]_{G,k}$

TS: $(\delta\sigma_1(\text{read }t_1\ t_2), \delta\sigma_2(\text{read }t_1'\ t_2')) \in (\delta\{P\star\gamma\to\beta\}\ \exists_.\tau\ \{P\star\gamma\to\beta\})_{G,k}^{E,0}$ Because read $t_1\ t_2$ is a value.

STS: $(\delta \sigma_1(\text{read } t_1 \ t_2), \delta \sigma_2(\text{read } t_1' \ t_2')) \in \{ \delta \{P \star \gamma \to \beta\} \} \exists_{-}.\tau \{P \star \gamma \to \beta\} \}_{G,k}$

Unfold the definition of $\{\delta \{P \star \gamma \to \beta\}\}$ $\exists_{-\tau} \{P \star \gamma \to \beta\}$ $\}_{G,k}$. Pick $G' \supseteq G$, H_1 , $H_2, k' \le k$, k'' < k', k'''. Assume $(H_1, H_2) \vDash_{G',k'} P \star \gamma \to \beta$ (1), $\delta \sigma_1$ (read $t_1 \ t_2$); $H_1 \ \bigcup_{f}^{k''}$ (2), $\delta\sigma_2(\text{read }t_1'\ t_2'); H_2 \downarrow_f^{k''}$ (3).

Because t_1, t_2 are sub terms of read t_1, t_2, t_1', t_2' are sub terms of read t_1', t_2' . From (2)(3), we get $\delta \sigma_1 t_1 \downarrow_f^{k_1}$ $\wedge \delta \sigma_1 t_2 \Downarrow_f^{k_2} (4), \delta \sigma_2 t_1' \Downarrow_f^{k_1'} \wedge \delta \sigma_2 t_2' \Downarrow_f^{k_2'} (5).$

From (4),(5), we get: $\exists l, n, k_1, k_2.\delta \sigma_1 t_1 \Downarrow^{k_1, c_1} l \wedge \delta \sigma_1 t_2 \Downarrow^{k_2, c'_1} n \wedge k'' = k_1 + k_2 + 1 \wedge c = c_1 + c'_1 + c_{read}$ (a), $\exists l', n', k'_1, k'_2. \delta\sigma_2 t'_1 \Downarrow^{k'_1, c_2} l' \wedge \delta\sigma_2 t'_2 \Downarrow^{k'_2, c'_2} n' \wedge k''' = k'_1 + k'_2 + 1 \wedge c' = c_2 + c'_2 + c_{read} \ (b).$ From (a),(b) and evaluation rules we get:

$$\exists v. H_1; \delta \sigma_1(\text{read } t_1 \ t_2) \downarrow_f^{k'',c} v; H_1 \land H_1(l)[n] = v \tag{c}$$

$$\exists v'. H_2; \delta\sigma_2(\text{read } t_1' \ t_2') \ \psi_f^{k''',c'} \ v'; H_2 \wedge H_2(l')[n'] = v' \tag{d}$$

By IH on the first premise instantiated with $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k'}$ by lemma 1. we get: $(\delta \sigma_1 t_1, \delta \sigma_2 t_1') \in$ $\|\operatorname{Array}_{\gamma}[I] \, \delta \tau \|_{G',k'}^{E,D_1}$ (6). Unfold (6), since $k_1 \leq k'$ and $\delta \sigma_1 t_1 \Downarrow^{k_1} l$ and $\delta \sigma_2 t_1' \Downarrow l'$, we know:

$$(l, l') \in (\operatorname{Array}_{\gamma}[I] \, \delta \tau)_{G', k'-k_1} \wedge c_1 - c_2 \le \delta D_1$$
 (e)

From (e), we know: $G'(\gamma) = (l, l', \tau, I)$ (7). By IH on the second premise instantiated with $(\sigma_1, \sigma_2) \in$ $\|\delta\Gamma\|_{G',k'}$ by lemma 1. we get: $(\delta\sigma_1t_2,\delta\sigma_2t'_2)\in (\delta \operatorname{int}_r[I'])_{G',k'}^F$ (8). Unfold (8), since $k_2\leq k'$, we know that $(n, n') \in \{\inf_{r} [I']\}_{G', k'-k_2} \Rightarrow n = n' = I' \land c'_1 - c'_2 \le \delta D_2(f).$ Let us assume: G' = G'(g).

STS1: $(H_1, H_2) \models_{G', k'-k''} P \star \gamma \rightarrow \beta$. By Lemma 7 and (1), this is proved.

STS2: $(v, v') \in (\Box \tau)_{G', k'-k''}$. from (c),(d). we know $H_1(l)[n] = v$ and $H_2(l')[n'] = v'$, based on (e) and (f), unfold (1), we know: $\forall i \leq n$, $(H_1(l)(i), H_2(l')(i)) \in (\tau)_{G', k'-1}$. s.t we know that $(H_1(l)[n], H_2(l')[n']) \in (\tau)_{G', k'-1}$. $\|\tau\|_{G',k'-1}$. Because $k'-k'' \le k'-1$, By Lemma 1, We get: $(v,v') \in \|\tau\|_{G',k'-k''}$, consider the premise $i \notin \beta$, we know v = v', so that we prove $(v, v') \in (\Box \tau)_{G', k' - k''}$.

STS3: $c - c' \le \delta(D_1 + D_2)$, which is proved by (e),(f).

This completes the proof of case read-box.

$$\text{CASE} \frac{ \Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \qquad \Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathsf{int}[I'] }{ \Sigma; \Delta; \Phi; \Gamma \vdash t_3 \ominus t_3' \lesssim D_3 : \tau \qquad \Delta; \Phi \models I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf } \\ \Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{updt} \ t_1 \ t_2 \ t_3 \ominus \mathsf{updt} \ t_1' \ t_2' \ t_3' \lesssim 0 : \{P \star \gamma \to \beta\} \ \exists_: \mathsf{unit}_r \ \{P \star \gamma \to \beta \cup \{I'\}\} \}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\![\delta \Gamma]\!]_{G,k}$

TS: $(\delta \sigma_1(\mathsf{updt}\ t_1\ t_2\ t_3), \delta \sigma_2(\mathsf{updt}\ t_1'\ t_2'\ t_3')) \in (\delta(\{\gamma \to \beta\}\ \exists_{-}.\mathsf{unit}\ \{\gamma \to \beta \cup \{I'\}\})) \stackrel{E,0}{\circ}_{G,k}$

Because updt t_1 t_2 t_3 is value.

STS:
$$(\delta \sigma_1(\mathsf{updt}\ t_1\ t_2\ t_3), \delta \sigma_2(\mathsf{updt}\ t_1'\ t_2'\ t_3')) \in (\![\delta(\{\gamma \to \beta\}\ \exists_.\mathsf{unit}\ \{\gamma \to \beta \cup \{I'\}\})]\!]_{G,k}$$

Unfold the definition of $\|\delta(\{\gamma \to \beta\} \exists _. \text{unit } \{\gamma \to \beta \cup \{I'\}\})\|_{G,k}$.

Pick $G^{'} \supseteq G$, H_1 , $H_2, k' \le k, k'' < k', k'''$. Assume $(H_1, H_2) \vDash_{G', k'} P \star \gamma \to \beta \land H_1 = H_{p1} \uplus H_{l1} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l1} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l1} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l2} = H_{p2} \uplus H_{l2} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l2} = H_{p2} \uplus H_{l2} \land H_{l2} \to H_{l2} \lor H_{l2} \lor H_{l2} \to H_{l2} \lor H_{l2} \lor H_{l2} \to H_{l2} \lor H_{l2}$ $l \to [v, \dots, v] \land H_2 = H_{p2} \uplus H_{l2} \land H_{l2} = l' \to [v', \dots, v'](1) , \delta\sigma_1(\mathsf{updt}\ t_1\ t_2\ t_3); H_1 \Downarrow_f^{k''}(2), \delta\sigma_2(\mathsf{updt}\ t_1'\ t_2'\ t_3'))$); $H_2 \downarrow_f^{k'''}$ (3).

Because t_1, t_2, t_3 are sub terms of updt t_1 t_2 t_3 , t_1', t_2' , t_3' are sub terms of updt t_1' t_2' t_3' . From (2)(3), we get

 $\delta\sigma_{1}t_{1} \Downarrow_{f}^{k_{1}} \wedge \delta\sigma_{1}t_{2} \Downarrow_{f}^{k_{2}} \wedge \delta\sigma_{1}t_{3} \Downarrow_{f}^{k_{3}} (4), \delta\sigma_{2}t_{1}' \Downarrow_{f}^{k_{1}'} \wedge \delta\sigma_{2}t_{2}' \Downarrow_{f}^{k_{2}'} \wedge \delta\sigma_{2}t_{3}' \Downarrow_{f}^{k_{3}'} (5).$ From (4),(5), we get:\(\frac{1}{3}l, n, v, k_{1}, k_{2}, k_{3}.\delta\sigma_{1}t_{1} \psi_{1}k_{1}, c_{1} l \times \delta\sigma_{1}t_{2} \psi_{2}k_{2}, c_{1}' n \times \delta\sigma_{1}t_{3} \psi_{3}k_{3}'' v \times k'' = k_{1} + k_{2} + k_{3} + 1 \times c = c_{1} + c_{1}' + c_{1}'' + c_{update}(a). \text{ and } \frac{1}{3}l', n', v', k_{1}', k_{2}', k_{3}'. \delta\sigma_{2}t_{1}' \psi_{4}^{k_{1}, c_{2}} l' \times \delta\sigma_{2}t_{2}' \psi_{4}^{k_{2}, c_{2}'} n' \times \delta\sigma_{2}t_{3}' \psi_{4}^{k_{3}, c_{2}''} v' \times c' = c_{1} + c_{1}' + c_{1}'' + c_{2}'' + c_{2}'' + c_{3}'' + c_{4}'' $c_2 + c_2' + c_2'' + c_{update}(b)$.

From evaluation rule: E-Update-F and (a)(b), we know:

updt
$$t_1 \ t_2 \ t_3; H_1 \downarrow ^{k'',c} (); H_1(l)[n] \leftarrow v$$
 (c)

updt
$$t'_1 t'_2 t'_3; H_2 \downarrow^{k''',c'} (); H_2(l')[n'] \leftarrow v'$$
 (d)

By IH on first premise instantiated with $(\sigma_1, \sigma_2) \in (\delta\Gamma)_{G', k'}$ by lemma 1. We get:

$$(\delta \sigma_1 t_1, \delta \sigma_2 t_1') \in (Array_{\gamma}[I] \delta \tau)_{G', k'}^{E, \delta D_1}$$
(6)

Similarly, By IH on the second premise and third premise, we get: $(\delta \sigma_1 t_2, \delta \sigma_2 t_2') \in (\inf_{\Gamma[I]})_{G', k'}^{E, \delta D_2}(7)$, $(\delta\sigma_1t_3, \delta\sigma_2t_3') \in \{\tau\}_{G',k'}^{E,\delta D_3}$ (8). From (6),(7),(8), we know:

$$(l, l') \in (Array_{\gamma}[I] \tau)_{G', k'-k_1} \Rightarrow G'(\gamma) = (l, l', \tau, I) \land c_1 - c_2 \le D_1$$
 (e)

$$(n,n')\in \{\inf_{I}[I]\}_{G,k'-k_2}\Rightarrow n=n'=I\wedge c_1'-c_2'\leq D_2 \tag{f}$$

$$(v, v') \in (\tau)_{G', k'-k_3} \land c_1'' - c_2'' \le D_3$$
 (g)

Let us assume: G'' = G'(9), $H'_1 = H_1(l)[n] \leftarrow v \land H'_2 = H_2(l')[n'] \leftarrow v'(10)$

STS1: $(H'_1, H'_2) \vDash_{G', k'-k''} P \star \gamma \to \beta \cup \{I'\}$

Unfold (1) and consider (e), we know: $\forall i \leq I.(H_{l1}(l)[i], H_{l2}(l')[i]) \in (\tau)_{G',k'-1}(11), \forall i \leq I.(H_{l1}(l)[i] \neq I.(H_{l1}(l)[i])$ $H_{l2}(l')[i]) \Rightarrow i \in \beta(12)$. Since (e), we need to prove two sub cases.

subgoal 1: $\forall i \leq I.(H'_{l1}(l)[i], H'_{l2}(l')[i]) \in (\tau)_{G',k'-k''}$ when i=n, we prove $(H'_{l1}(l)[i], H'_{l2}(l')[i]) \in (\tau)_{G',k'-k_3}$ from (g) and (10), and then use lemma

when $i \neq n$, proved by using lemma 1 on (11)

subgoal 2: $\forall i \leq I.(H'_{l_1}(l)[i] \neq H'_{l_2}(l')[i]) \Rightarrow i \in \beta \cup \{I'\}$ when i=n, $n \in \{I'\}$ from (f) $\Rightarrow n \in \beta \cup \{I'\}$ when $i \neq n$, proved by using lemma 1 on (12)

STS2: $((), ()) \in (\text{unit}_r)_{G', k'-k''}$. It is proved by unfolding the definition.

STS3 $c - c' \le \delta(D_1 + D_2 + D_3)$. It is proved by (e),(f),(g).

This completes the proof of case update.

$$\text{CASE} \frac{ \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \qquad \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathsf{int}[I'] }{ \Delta; \Phi; \Gamma \vdash t_3 \ominus t_3' \lesssim D_3 : \Box \tau \qquad \Delta; \Phi \vDash I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf } \\ \frac{\mathsf{diff}(D_1 + D_2 + D_3)}{ \Delta; \Phi; \Gamma \vdash \mathsf{updt} \ t_1 \ t_2 \ t_3 \ominus \mathsf{updt} \ t_1' \ t_2' \ t_3' \lesssim 0 : \{P \star \gamma \to \beta\} \ \exists_: \mathsf{unit}_r \ \{P \star \gamma \to \beta \setminus \{I'\}\} }$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\![\delta \Gamma]\!]_{G,k}$

TS: $(\delta\sigma_1(\mathsf{updt}\ t_1\ t_2\ t_3), \delta\sigma_2(\mathsf{updt}\ t_1'\ t_2'\ t_3')) \in \{\delta(\{P\star\gamma\to\beta\}\ \exists_.\mathsf{unit}\ \{P\star\gamma\to\beta\setminus\{I'\}\})\}_{G,k}^{E,0}$ Because updt t_1 t_2 t_3 is value.

STS: $(\delta\sigma_1(\mathsf{updt}\ t_1\ t_2\ t_3), \delta\sigma_2(\mathsf{updt}\ t_1'\ t_2'\ t_3')) \in (\delta(\{P\star\gamma\to\beta\}\ \exists_.\mathsf{unit}\ \{P\star\gamma\to\beta/\{I'\}\}))|_{G,k}$ Unfold the definition of $(\delta(\{P\star\gamma\to\beta\}\exists_.\mathrm{unit}\ \{P\star\gamma\to\beta\setminus\{I'\}\}))_{G,k}$.

Pick $G' \supseteq G$, H_1 , $H_2, k' \le k$, k'' < k', k'''. Assume $(H_1, H_2) \vDash_{G', k'} P \star \gamma \to \beta \land H_1 = H_{p1} \uplus H_{l1} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l1} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l1} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l1} = H_{p1} \uplus H_{l2} \land H_{l2} \to H_{l2} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l2} = H_{p2} \uplus H_{l2} \land H_{l2} = H_{p1} \uplus H_{l2} \land H_{l2} = H_{p2} \uplus H_{l2} \land H_{l2} = H_{p2} \uplus H_{l2} \land H_{l2} \to H_{l2$ $l \rightarrow [v,\ldots,v] \land H_2 = H_{p2} \uplus H_{l2} \land H_{l2} = l' \rightarrow [v',\ldots,v'] \\ (1) \ \delta\sigma_1 \\ (\text{updt } t_1 \ t_2 \ t_3); H_1 \ \psi_f^{k''} \\ (2) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_1 \\ (2) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_1 \\ (3) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_2 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_1 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_2 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_1 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_2 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_1 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_2 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_2 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_3 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_3 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_3 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_3 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_2' \ t_3'); H_3 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_3'); H_3 \\ (4) \ \delta\sigma_2 \\ (\text{updt } t_1' \ t_3'); H_4 \\ (4) \ \delta\sigma_2 \\ (4) \ \delta\sigma_2 \\ (4) \ \delta\sigma_3 \\ (4) \$); $H_2 \downarrow_f^{k'''}$ (3).

Because t_1, t_2, t_3 are sub terms of updt t_1 t_2 t_3 , t_1', t_2' , t_3' are sub terms of updt t_1' t_2' t_3' From (2)(3), we get: $\delta \sigma_1 t_1 \Downarrow_f^{k_1} \land \delta \sigma_1 t_2 \Downarrow_f^{k_2} \land \delta \sigma_1 t_3 \Downarrow_f^{k_3}$ (4), $\delta \sigma_2 t_1' \Downarrow_f^{k_1'} \land \delta \sigma_2 t_2' \Downarrow_f^{k_2'} \land \delta \sigma_2 t_3' \Downarrow_f^{k_3'}$ (5). From (4),(5), we get: $\exists l, n, v, k_1, k_2, k_3.\delta \sigma_1 t_1 \Downarrow_{k_1, c_1} l \land \delta \sigma_1 t_2 \Downarrow_{k_2, c_1'} n \land \delta \sigma_1 t_3 \Downarrow_{k_3, c_1''} v \land k'' = k_1 + k_2 + k_3 + k_3 + k_4 + k_5 + k$

 $1 \wedge c = c_1 + c_1' + c_1'' + c_{update}(a)$

 $\exists l', n', v', k'_1, k'_2, k'_3, \delta\sigma_2 t'_1 \Downarrow^{k'_1, c_2} l' \wedge \delta\sigma_2 t'_2 \Downarrow^{k'_2, c'_2} n' \wedge \delta\sigma_2 t'_3 \Downarrow^{k'_3, c''_2} v' \wedge c' = c_2 + c'_2 + c''_2 + c_{update}(b).$ From evaluation rule: **E-Update-F** and (a)(b), we know:

updt
$$t_1 \ t_2 \ t_3; H_1 \downarrow^{k'',c}(); H_1(l)[n] \leftarrow v$$
 (c)

updt
$$t'_1 t'_2 t'_3; H_2 \downarrow^{k''',c'} (); H_2(l')[n'] \leftarrow v'$$
 (d)

By IH on first premise instantiated with $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k'}$ by lemma 1. We get:

$$(\delta \sigma_1 t_1, \delta \sigma_2 t_1') \in (Array_{\gamma}[I] \delta \tau)_{G'k'}^{E, \delta D_1}$$
(6)

Similarly, By IH on the second premise and third premise, we get

$$(\delta \sigma_1 t_2, \delta \sigma_2 t_2') \in (\delta \operatorname{int}_r[I])_{G', k'}^{E, \delta D_2}$$
(7)

$$(\delta\sigma_1 t_3, \delta\sigma_2 t_3') \in (\square \delta\tau)_{G', k'}^{E, \delta D_3}$$
(8)

From (6),(7),(8), we know:

$$(l, l') \in (Array_{\gamma}[I] \tau)_{G', k'-k_1} \Rightarrow G'(\gamma) = (l, l', \tau, I) \land c_1 - c_2 \le \delta D_1$$
 (e)

$$(n, n') \in \{\inf_r[I]\}_{G, k'-k_2} \Rightarrow n = n' = I \land c_1' - c_2' \le \delta D_2$$
 (f)

$$v = v' \land (v, v') \in (\tau)_{G', k' - k_3} c_1'' - c_2'' \le \delta D_3$$
 (g)

Let us assume: G'' = G'(9), $H'_1 = H_1(l)[n] \leftarrow v \land H'_2 = H_2(l')[n'] \leftarrow v'(10)$.

STS1: $(H'_1, H'_2) \vDash_{G', k'-k''} P \star \gamma \rightarrow \beta/\{I'\}$

Unfold (1) and consider (e), we know $\forall i \leq I.(H_{l1}(l)[i], H_{l2}(l')[i]) \in (\delta \tau)_{G',k'-1}(11) \ \forall i \leq I.(H_{l1}(l)[i] \neq I)$ $H_{l2}(l')[i]) \Rightarrow i \in \beta(12)$. Since (e), we need to prove two sub cases.

subgoal 1: $\forall i \leq I.(H'_{l1}(l)[i], H'_{l2}(l')[i]) \in (\![\tau]\![]_{G',k'-k''})$ when i=n, we prove $(H'_{l1}(l)[i], H'_{l2}(l')[i]) \in (\![\tau]\![]_{G',k'-k_3})$ from (g) and (10), and then use lemma

when $i \neq n$, proved by using lemma 1 on (11)

subgoal 2: $\forall i \leq I.(H'_{l_1}(l)[i] \neq H'_{l_2}(l')[i]) \Rightarrow i \in \beta/\{I'\}$

when i=n, $H'_1(l)[i] = H'_2(l)[i]$, it is trivially proved. when $i \neq n$, proved by using lemma 1 on (12)

STS2: $((), ()) \in \{\text{unit}_r\}_{G', k'-k''}$ It is proved by unfolding the definition.

STS3 $c - c' \le \delta(D_1 + D_2 + D_3)$. It is proved by (e),(f),(g).

This completes the proof of case update-box.

$$\text{CASE} \ \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash \text{return } t_1 \ominus \text{return } t_2 \lesssim 0 : \{P\} \ \exists_.\tau \ \{P\}} \ \text{R-T}$$

Assume that $\vdash \delta : \Delta$ and $\models \Phi \delta$ and $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$ TS: $(\delta \sigma_1(\text{return } t_1), \delta \sigma_2(\text{return } t_2)) \in (\delta \{P\})_{G,k}^{\text{diff}(D)}$

Because return t is value, STS: $(\delta \sigma_1(\text{return } t_1), \delta \sigma_2(\text{return } t_2)) \in (\delta \{P\} \exists_{-}.\tau \{P\}) \cap \{P\})$

Unfold the definition of $\{\delta P\} \exists \tau P\} \cap G_{k}$. Pick $G' \supseteq G$, H_1 , H_2 , $k' \le k$, k'' < k', k'''. Assume $(H_1, H_2) \vDash_{G', k'}$ P(1), $\delta\sigma_1(\operatorname{return} t_1)$; $H_1 \downarrow_f^{k''}(2)$, $\delta\sigma_2(\operatorname{return} t_2)$; $H_2 \downarrow_f^{k'''}(3)$.

Because t_1 is the subterm of return t_1 . From (2)(3), We know: $\delta \sigma_1 t_1 \downarrow^{k_1}$ (4), $\delta \sigma_2 t_2 \downarrow^{k'''}_f$ (5). From (4),(5), we know:

$$\exists v_1, k_1, \delta \sigma_1 t_1 \downarrow^{k_1, c_1} v_1 \land k'' = k_1 + 1 \land c = c_1 + c_{ret}$$
 (a)

$$\exists v_2, k'_1, \delta \sigma_2 t_2 \downarrow^{k'_1, c_2} v_2 \land k''' = k'_1 + 1 \land c' = c_2 + c_{ret}$$
 (b)

From (a),(b) and the evaluation rule **R-ret**: H_1 ; return $t_1 \bigvee_f^{k'',c} v_1$; $H_1(c)$, H_2 ; return $t_2 \bigvee_f^{k''',c'} v_2$; $H_2(d)$.

By IH on the premise instantiated with $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G', k'}$ by lemma 1. We get: $(\delta \sigma_1 t_1, \delta \sigma_2 t_2) \in (\delta \tau)_{G', k'}^{E, \delta D}$ (6).

Unfold (6), we get: $(v_1, v_2) \in (\delta \tau)_{G', k'-k_1}(7)$. Let us assume: G'' = G'(8), $H'_1 = H'_1 \wedge H'_2 = H'_2 \leftarrow v'(9)$.

STS1: $(H'_1, H'_2) \models_{G', k'-k''} P$. It is trivially true.

STS2: $(v_1, v_2) \in (\tau)_{G', k'-k''}$. It is proved by (7) using Lemma 1.

STS3: $c - c' \le \delta D$ which is proved from (a),(b).

This completes the proof.

Assume that $\vdash \delta : \Delta$ and $\models \delta \Phi$ and $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$

TS: $(\delta \sigma_1(\text{let } \{x\} = t_1 \text{ in } t_1'), \delta \sigma_2(\text{let } \{x\} = t_2 \text{ in } t_2')) \in (\delta \{P\}) \xrightarrow{\text{diff}(D+D'+D_1+D_2)} \{Q \star Q_2\})_{G.k}^{E,0}$ Because let $\{x\} = t_1$ in t'_1 is value.

 $\text{STS: } (\delta\sigma_1(\text{let } \{x\} = t_1 \text{ in } t_1'), \delta\sigma_2(\text{let } \{x\} = t_2 \text{ in } t_2')) \in (\![\delta\ \{P\}\ \exists \vec{\gamma_1}\vec{\gamma_2} : \tau_2\ \{Q \star Q_2\}]\!]_{G,k}$

Unfold the definition of $(\delta \{P\} \exists \vec{\gamma}_1 \vec{\gamma}_2 : \tau_2 \{Q \star Q_2\})_{G,k}$.

Pick $G' \supseteq G$, H_1 , $H_2, k' \le k$, k'' < k', k'''. Assume $(H_1, H_2) \models_{G', k'} P(1)$, $\delta \sigma_1(\text{let } \{x\} = t_1 \text{ in } t_1')$; $H_1 \downarrow_f^{k''} (2)$, $\delta\sigma_2(\operatorname{let}\{x\}=t_2 \text{ in } t_2'); H_2 \downarrow_f^{k'''}(3).$

Because t_1 is the subterm of let $\{x\} = t_1$ in t_1' . From (2) ,we know: $\exists v_1, v_1', v_1'', v_1''', k_1, k_2, k_3, k_4, H_1', H_1''.\delta\sigma_1 t_1 \downarrow^{k_1, c_1}$ $v_1 \wedge v_1; H_1 \downarrow^{k_2, c_1'}_{f} v_1''; H_1' \delta\sigma_1 t_1' [v_1'/x] \downarrow^{k_3, c_1''}_{f} v_1'''; H_1' \downarrow^{k_4, c_1'''}_{f} v_1'''; H_1'' \wedge k'' = k_1 + k_2 + k_3 + k_4 + 1 \wedge c = k_1 + k_2 + k_3 + k_4 +$ $c_1 + c'_1 + c''_1 + c'''_1 + c_{let}(a)$.

Similarly, from (3), we get: $\exists v_2, v_2', v_2'', v_2''', k_1', k_2', k_3', k_4', H_2', H_2''$. $\delta \sigma_1 t_2 \Downarrow^{k_1', c_2} v_2$ and $v_2; H_2 \Downarrow^{k_2', c_2'}_f v_2'; H_2'$ and

 $\delta\sigma_1t_2'[v_2'/x] \downarrow^{k_3',c_2''} v_2'' \quad \text{and} \quad v_2''; H_2' \downarrow_f^{k_4',c_2'''} v_2'''; H_2'' \wedge k'' = k_1' + k_2' + k_3' + k_4' + 1 \wedge c' = c_2 + c_2' + c_2'' + c_2''' + c_{let}(b).$ From evaluation rule: E-Let-F and (a)(b), we know:

$$\exists H_a, H_c, H'_a, H1_{Q1}, H1_{Q2}, H1_Q, s.t. H_1 = H_a \uplus H_c \land v1; H_a \Downarrow_f v'_1; H'_a \land H'_a = H1_{Q1} \uplus H1_{Q2}$$

$$\land v''_1; H1_{Q1} \uplus H_c \Downarrow_f v'''_1; H1_Q \land H''_1 = H1_Q \uplus H1_{Q2}$$
 (c)

$$\exists H_a, H_c, H'_a, H1_{Q1}, H1_{Q2}, H1_Q, s.t. H_1 = H_a \uplus H_c \land v1; H_a \Downarrow_f v'_1; H'_a \land H'_a = H1_{Q1} \uplus H1_{Q2}$$
$$\land v''_1; H1_{Q1} \uplus H_c \Downarrow_f v'''_1; H1_Q \land H''_1 = H1_Q \uplus H1_{Q2}$$
(d)

From (1): $(H_1, H_2) \vDash_{G', k'} P_1 \star P_2$, we assume that

$$\exists G_a, G_b : (H_1 = H_a \uplus H_c) \quad \text{and} \quad (H_2 = H_b \uplus H_d)$$

$$(G' = G_a \uplus G_c) \quad \text{and} \quad (H_a, H_b) \vDash_{G_a, k'} P_1 \quad \text{and} \quad (H_c, H_d) \vDash_{G_c, k'} P_2 \tag{*}$$

 $STS1: (H_1'', H_2'') \vDash_{G'', k' - k''} Q \star Q_2. \ STS2: (v_1''', v_2''') \in (\tau_2)_{G'', k' - k''}. \ STS3: \ c - c' \le \delta(D_1 + D_2 + D + D').$

By IH on the second premise instantiated with $(\sigma_1, \sigma_2) \in (\delta\Gamma)_{G', k'}$, we know: $(\delta\sigma_1 t_1, \delta\sigma_2 t_2) \in (\{P_1\} \exists \vec{\gamma}_1.\tau \{Q_1 \star Q_2\})_{G', k'}^{E, D_1}(4)$.

Unfold the definition of $\{P_1\}$ $\exists \vec{\gamma}_1.\tau \{Q_1 \star Q_2\}\}_{G',k'}^{E,D_1}$, use (a), we get: $\{v_1,v_2\} \in \{P_1\}$ $\exists \vec{\gamma}_1.\tau_1 \{Q_1 \star Q_2\}\}_{G',k'-k_1} \land c_1 - c_2 \leq D_1(e)$.

To unfold (e), we choose: $k_f \le k' - k_1$ and $k'_f < k_f$ and $G_f \supseteq G'$ and $H_a \uplus H_c, H_b \uplus H_d$ and (1),(a),(b). We have $(H_a, H_b) \vDash_{G_f, k_f} P_1 \land \nu_1; H_a \Downarrow_f \land \nu_2; H_b \Downarrow_f$.

Unfold the definition, we get: $v_1; H_a \Downarrow_f^{c_1'} v_1'; H_a' \land v_2; H_b \Downarrow_f^{c_2'} v_2'; H_b' \land H_a', H_b' \models Q_1 \star Q_2.$

$$(v_1', v_2') \in \{\tau_1\}_{G', k'-k_1} \land c_1' - c_2' \le \delta D$$
 (k)

By IH on the third premise, we know: $(\delta\sigma_1v_1'',\delta\sigma_2v_2'') \in \{Q_1 \star P_2\} \exists \vec{\gamma_1}.\tau \{Q\}\}_{G'.k'}^{E,D_2}$ (5).

Unfold the definition of $({Q_1 \star P_2} \exists \vec{\gamma_1}.\tau_2 \{Q\})_{G',k'}^{E,D_2}$, use (a), we get:

 $(v_1,v_2) \in (\![\{Q_1 \star P_2\} \, \exists \vec{\gamma_1}.\tau_2 \, \{Q\}\}\!)_{G',k'-k_1} \land c_1'' - c_2'' \leq D_2(f) \text{ We have } (H_a',H_b') \vDash_{G_f,k_f} Q_1 \star Q_2 \Rightarrow H1_{Q1},H2_{Q1} \vDash Q_1 \land H1_{Q2},H2_{Q2} \vDash Q_2 \land H_c,H_d \vDash P_2,H1_{Q1} \uplus H_c;v_1''' \Downarrow_f \land H2_{Q1} \uplus H_d;v_2''' \Downarrow_f.// \text{ Unfold the definition of } (f), \text{ we get: } H1_{Q1} \uplus H_c;v_1''' \Downarrow_f^{c_1'''} \land H2_{Q1} \uplus H_d;v_2''' \Downarrow_f^{c_2'''} \land H1_Q,H2_Q \vDash Q.$

$$(v_1''', v_2''') \in (\tau_2)_{G', k'-k_1} \wedge c_1''' - c_2''' \le \delta D'$$
(g)

STS1: Use Lemma 2, we know that $H1_O \uplus H1_{O2}$, $H2_O \uplus H2_{O2} \vDash Q \star Q_2$.

STS2: it is proved from (g).

STS3: it is proved from (e),(k),(f),(g).

This completes the proof of let case.

CASE
$$\frac{\Delta; \Phi; |\Gamma|_1 \vdash_{L_1}^{U_1} t_1 : A_1 \qquad \Delta; \Phi; |\Gamma|_2 \vdash_{L_2}^{U_2} t_2 : A_2}{\Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \leq U_1 - I_2 : U(A_1, A_2)} \xrightarrow{\text{R-SWITCH}}$$

Assume that $\vdash \delta : \Delta$ and $\models \delta \Phi$ and $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$. TS: $(\delta \sigma_1(t_1), \delta \sigma_2(t_2)) \in (\delta U(A_1, A_2))_{G,k,\delta(U_1 - L_2)}^{E,(\delta(U_1 - L_2))}$

Unfold the definition. Assume: $\delta \sigma_1 t_1 \downarrow^{k_1,c} v_1(a)$, $\delta \sigma_2 t_2 \downarrow^{k_2,c'} v_2(b)$, $k_1 < k(c)$.

TS 1: $(v_1, v_2) \in \{U(\delta A_1, \delta A_2)\}_{G,k-k_1}$. TS 2: $c - c' \le \delta(U_1 - L_2)$

We prove TS 1 first. Unfold its definition, STS: $\forall k'. v_1 \in (\delta A_1)_{G_{11},k'}$ and $v_2 \in (\delta A_2)_{G_{12},k'}$

Pick k'. By IH 2 on the first premise using $FV(t_1) \subseteq dom(\delta|\Gamma|_1)$ using Lemma 5. $\models \delta\Phi$, $\forall k.\sigma_1 \in (\![\delta|\Gamma|_1]\![G]_{1,k})$. We get: $\forall k.\delta\sigma_1\,t_1 \in (\![\delta A_1]\![E]_{G|_1,k})$ we know $v_1 \in (\![\delta A_1]\![G]_{1,k})$ $\land \delta L_1 \leq c \leq \delta U_1(d)$.

By IH 2 on the second premise using $\forall k.\sigma_2 \in (\![\delta|\Gamma|_2]\!]_{G|_2,k}$. We get: $\forall k.\delta\sigma_2 t_2 \in [\![\delta A_2]\!]_{G|_2,k}^{E,(\delta L_2,\delta U_2)}$ (2). Unfold

the definition of (1), choose $k = k_2 + k'$, we know $v_2 \in [\![\delta A_2]\!]_{G_{[2,k']}} \land \delta L_2 \le c' \le \delta U_2(e)$. (d),(e) finished the proof of STS1. (d),(e) finished the proof of STS2.

This completes the proof of switch case.

$$\text{CASE} \ \frac{\Delta; \Phi; |\Gamma|_1 \vdash_{L_1}^{U_1} t_1 : \overset{\text{exec}(L,U)}{A_1 \longrightarrow A_2} \qquad \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : U(A_1,A_2')}{\Delta; \Phi; \Gamma \vdash t_1 \ t_2 \ominus t_2' \lesssim U_1 + U + D_2 + c_{app} : U(A_2,A_2')} \ \text{$_{\text{R}}$-APP-E}$$

and $\delta \sigma_2 t_2' \Downarrow^{c',k'} v'$ (\Leftrightarrow). STS1: $(v_r, v') \in (\delta \tau)_{G,k-(k_1+k_r+1)}$. STS2: $c_1 + c_r + c_{lt} - c' \leq \delta(D_2 + U_1 + c_{lt})$. To prove $\exists \forall k. \nu_1 \in \llbracket \delta A_1 \rrbracket_{|G|_1,k})$.

Proof. Pick k. IH2 on the first premise.

- 1. $FV(t_1) \subseteq |\delta\Gamma|_1$ using Lemma 5.
- 2. $\sigma_1 \in (|\delta\Gamma|_1)_{|G|_1, k+\delta U_1+1}$ by Lemma 6 using assumptions.

We get: $\sigma_1 t_1 \in \llbracket \delta A_1 \rrbracket_{|G|_1,k+\delta U_1+1}^{E,(\delta L_1,\delta U_1)}$. Unfold the defintion, we know: $\delta L_1 \leq c_1 \leq \delta U_1$ (a) and $v_1 \in \llbracket \delta A_1 \rrbracket_{|G|_1,k+\delta u_1+1-c_1}$. So, we know: $v_1 \in \llbracket \delta A_1 \rrbracket_{|G|_1,k}$ by Lemma 1.

By IH on the second premise using

- 1. $(\sigma_1[v_1/x], \sigma_2[v_1/x]) \in (\delta \Gamma, x : U(\delta A_1, \delta A_1))_{G,k}$ using
 - 1.1. $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$
 - 1.2. $(v_1, v_1) \in (U(\delta A_1, \delta A_1))_{G, k}$

we get: $(\delta\sigma_1[\nu_1/x]t_2, \delta\sigma_2[\nu_1/x]t_2') \in (\delta\tau)_{G,k}^{E,\delta D_2}$.

Since x does not occur free in t_2' , we have : $(\delta \sigma_1[\nu_1/x]t_2, \delta \sigma_2 t_2') \in (\delta \tau)_{G,k}^{E,\delta D_2}$. Unfold the defintion, we have: $c_r - c_1' \le \delta D_2(b)$, $(v_r, v') \in (\delta \tau)_{G, k-k_r}(c)$.

STS1 is proved by using Lemma 1 on (c) because $k - (k_1 + k_r + 1) < k - k_r$. STS2 is proved by (a) and (b). This completes the proof of case R-lt-e.

$$\Sigma; \Delta; \Phi; |\Gamma|_1 \vdash_{L_1}^{U_1} t : A_1 + A_2$$

$$\Sigma; \Delta; \Phi; \Gamma, x : U(A_1, A_1) \vdash t_1 \ominus t' \lesssim D_2 : \tau \qquad \Sigma; \Delta; \Phi; \Gamma, y : U(A_2, A_2) \vdash t_2 \ominus t' \lesssim D_2 : \tau$$

$$\Sigma; \Delta; \Phi; \Gamma \vdash \text{ case } (t, x.t_1, y.t_2) \ominus t' \lesssim U_1 + D_2 + c_{case} : \tau$$
 R-CASE-E

Assume that $\vdash \delta : \Delta$ and $\models \delta \Phi$ and $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$

TS: $(\delta\sigma_1(\text{ case }(t,x.t_1,y.t_2)), \delta\sigma_2(t')) \in (\delta\tau)_{G,k}^{E,\delta(D_2+U_1+c_{case})}$.

Following the definition of $(\delta \tau)_{G,k}^{E,\delta(D_2+U_1+c_{case})}$, assume that: $\delta \sigma_1$ case $(t,x.t_1,y.t_2) \downarrow^{C,K} v_r$ and $\delta \sigma_2 t' \downarrow^{c',k'} v'$ (\Leftrightarrow) and C < k.

STS1: $(v_r, v') \in (\delta \tau)_{G,k-K}$. STS2: $C - c' \le \delta(D_2 + U_1 + c_{case})$.

To prove : $\forall k. v_1 \in [\delta A_1]_{[G_1, k]}$. Depending on what $\delta \sigma_1 t$ evaluates to, there are two cases.

Subcase1:

$$\frac{\delta\sigma_1 t \Downarrow^{c_1,k_1} \mathsf{in} | v_1 \ (\star) \qquad \delta\sigma_1 t_1 [v_1/x] \Downarrow^{c_r,k_r} v_r \ (\spadesuit)}{\delta\sigma_1 \mathsf{case} \ (t,x.t_1,y.t_2) \Downarrow^{c_1+c_r+c_{\mathsf{case}},k_1+k_r+1} v_r} \mathsf{CASE\text{-}INL}$$

To prove: $\forall k.(\mathsf{inl}\,v_1) \in (\delta A_1 + \delta A_2)_{G,k}$.

Proof. Pick k. IH2 on the first premise.

- 1. $FV(t) \subseteq |\delta\Gamma|_1$ using Lemma 5.
- 2. $\sigma_1 \in (|\delta\Gamma|_1)_{|G|_1, k+\delta U_1+1}$ by Lemma 6 using assumptions.

We get: $\sigma_1 t \in [\![\delta A_1 + \delta A_2]\!]_{|G|_1, k + \delta U_1 + 1}^{E, (\delta L_1, \delta U_1)}$. Unfold the defintion, we know: $\delta \sigma_1 t \downarrow^{c_1, k_1} \text{inl } v_1$ and $\delta L_1 \leq c_1 \leq \delta U_1$ (a) and $\text{inl } v_1 \in [\![\delta A_1 + \delta A_2]\!]_{|G|_1, k + \delta U_1 + 1 - c_1}$.

So, we know: $\operatorname{inl} v_1 \in [\![\delta A_1 + \delta A_2]\!]_{|G|_1,k}$ by Lemma 1.

By IH on the second premise using

- 1. $(\sigma_1[v_1/x], \sigma_2[v_1/x]) \in (\delta\Gamma, x : U(\delta A_1, \delta A_1))_{G,k}$ using
 - 1.1. $(\sigma_1, \sigma_2) \in (\delta \Gamma)_{G,k}$
 - 1.2. $(v_1, v_1) \in (U(\delta A_1, \delta A_1))_{G,k}$

we get: $(\delta \sigma_1[\nu_1/x]t_1, \delta \sigma_2[\nu_1/x]t') \in (\delta \tau)_{G,k}^{E,\delta D_2}$.

Since x does not occur free in t', we have : $(\delta \sigma_1[\nu_1/x]t_1, \delta \sigma_2 t') \in (\delta \tau)_{G,k}^{E,\delta D_2}$.

Unfold its defintion, we get: $c_r - c_1' \le \delta D_2$ (b). $(v_r, v') \in (\delta \tau)_{G,k-k_r}$ (c).

STS1 is proved by using Lemma 1 on (c) because $k - (k_1 + k_r + 1) < k - k_r$. STS2 is proved by (a) and (b).

Subcase 2:

$$\frac{\delta\sigma_1 t \Downarrow^{c_1,k_1} \mathsf{inr} v_1 \ (\star) \qquad \delta\sigma_1 t_2 [v_1/x] \Downarrow^{c_r,k_r} v_r \ (\spadesuit)}{\delta\sigma_1 \mathsf{case} \ (t,x.t_1,y.t_2) \Downarrow^{c_1+c_r+c_{\mathsf{case}},k_1+k_r+1} v_r} \mathsf{CASE\text{-}INR}$$

Prove similarly: $\forall k.(\mathsf{inr}\,v_1) \in (\delta A_1 + \delta A_2)_{G.k}$.

IH on the third premise using

- 1. $(\sigma_1[v_1/x], \sigma_2[v_1/x]) \in (\delta\Gamma, x : U(\delta A_1, \delta A_1))_{G,k}$ using
 - 1.1. $(\sigma_1, \sigma_2) \in (\delta\Gamma)_{G,k}$
 - 1.2. $(v_1, v_1) \in (U(\delta A_1, \delta A_1))_{G,k}$

we get: $(\delta \sigma_1[v_1/x]t_2, \delta \sigma_2[v_1/x]t') \in (\delta \tau)_{G,k}^{E,\delta D_2}$. Since x does not occur free in t', we have : $(\delta \sigma_1[v_1/x]t_2, \delta \sigma_2 t') \in (\delta \tau)_{G,k}^{E,\delta D_2}$.

Unfold its defintion, we get: $c_r - c_1' \le \delta D_2$ (b) $(v_r, v') \in (\delta \tau)_{G,k-k_r}$ (c).

STS1 is proved by using Lemma 1 on (c) because $k - (k_1 + k_r + 1) < k - k_r$. STS2 is proved by (a) and (b).

$$\Sigma; \Delta; \Phi; |\Gamma|_1 \vdash_{L_1}^{U_1} t_1 : \{P_1\} \stackrel{\text{exec}(L,U)}{\exists \vec{\gamma}_1 : A_1} \{Q_1\} \qquad \Sigma; \Delta; \Phi; |\Gamma|_2 \vdash_{L_2}^{U_2} t_2' : \{P_2\} \stackrel{\text{exec}(L',U')}{\exists \vec{\gamma}_1 : A_1'} \{Q_2\}$$

and $v_1'; H_1' \bigvee_f^{c_2', k_2'} v_2'; H_2'$ (b). STS1: $(H_2, H_2') \vDash_{G, k' - k_2} Q$. STS2: $(v_{let}, v_2') \in (\delta \tau)_{G, k' - k_2}$. STS3: $c_2 - c_2' \le \delta((D_2 + U_2) + D' + U + U_1 + c_{let})$. exec(L, U) By IH2 on the first premise, we get: $\delta \sigma_1 t_1 \in (\delta(\{P_1\} \exists \vec{\gamma}_1 : A_1 \{Q_1\}))_{[G_1, k']}^{E, \delta(L_1, U_1)}$ (c). Unfold (c), we assume $\delta \sigma_1 t_1 \bigvee_{c_a, k_a} v$, we get: $v \in (\delta(\{P_1\} \exists \vec{\gamma}_1 : A_1 \{Q_1\}))_{[G_1, k - k_a]}^{E, \delta(L_1, U_1)}$ (d) and $\delta L_1 \le c_a \le \delta((D_1 + U_2) + D' + U + U_2)$. δU_1 (e). Unfold (d), pick $k_1 \le k - k_a$. assume $H_1 \vDash_{|G|_1, k_1} P_1$,

we know: $v; H_1 \Downarrow_f^{c_3, k_3} v_2; H_3$ and $H_3 \vDash_{|G|_1, k_1 - k_3} Q_1$ and $v_a \in (A)_{|G|_1, k_1 - k_3} \land \delta L \le c_3 \le \delta U(f)$ and $\exists n. P_1 = \{\gamma_1 \to T_1, \dots, \gamma_n \to T_n\} \land \forall i \in [1, n]. |G|_1(\gamma_i) = (l_i, A, m) \implies \forall j. H_1[l_i][j] \ne H_3[l_i][j] \implies j \in I_1(f)$

From (f), we know: $(\sigma_1[v_a/x], \sigma_2[v_a/x]) \in (\delta(\Gamma, x : U(A, A)))_{G,k}(h)$.

IH on the third premise instantiated with (h), we get:

$$(\delta\sigma_1[v_a/x](t_2), \delta\sigma_2[v_a/x](t_2')) \in \left\|\delta(\{P \sqcup P_1\} \; \exists \vec{\gamma_1}.\tau \; \{Q\})\right\|_{G,k}^{E,\delta(D_2)}(i)$$

Unfold (i), assume : $\delta \sigma_1[v_a/x]t_2 \Downarrow^{c_4,k_4} v_4$ and $\delta \sigma_2[v_a/x]t_2' \Downarrow^{c_1',k_1'} v_1'$.

we get: $(v_4, v_1') \in (\delta(\{P \sqcup P_1\} \exists \vec{\gamma_1}. \tau \{Q\}))|_{G,k} (j) \text{ and } c_4 - c_1' \leq \delta D_2 (k).$

Unfold (j), we assume :Pick $k_6 = k' - ka - k_3 - k_4 - 1 \le k - k_4$.

We first show the conclusion: $(H_3, H_1') \vDash_{G, k_6} P \sqcup P_1$ (\$\infty\$).

Proof. We have the assumption (z) and the assumption $H_1, H'_1 \models_{G,k} P$.

Unfold (\clubsuit) , we need to prove:

 $\forall \gamma \in dom(P) \cup dom(P_1). \exists l_1, l_2, \tau, n. G(\gamma) = (l_1, l_2, \tau, n) \land \forall i < n. H_3[\gamma][i] \neq H_1'[\gamma][i] \implies i \in (P \sqcup P_1)[\gamma]. (\star)$ Unfold the definition of H_1 , $H'_1 \vDash_{G,k} P$, we know:

 $\forall \gamma \in dom(P). \exists l_1, l_2, \tau, n. G(\gamma) = (l_1, l_2, \tau, n) \land \forall i < n. H_1[\gamma][i] \neq H'_1[\gamma][i] \implies i \in (P)[\gamma]. (\heartsuit)$

From the premise $dom(P) = dom(P_1)$, there is only one case:

1. $\gamma \in dom(P), \gamma \in dom(P_1)$

From (♥), we know

 $\forall \gamma \in dom(P) \cap dom(P_1). \exists l_1, l_2, \tau, n. G(\gamma) = (l_1, l_2, \tau, n) \land \forall i < n. H_1[\gamma][i] \neq H'_1[\gamma][i] \implies i \in (P)[\gamma],$ which means H_1 and H'_1 differ at most at indices in $P[\gamma]$, also means $\forall i < n. i \notin P[\gamma] \implies H_1[\gamma][i] =$ $H'_1[\gamma][i]$.

From (z), we also know that $\forall \gamma \in dom(P_1), \forall i < n.H_1[\gamma][i] \neq H_3[\gamma][i] \implies i \in P_1[\gamma]$, which means H_1 and H_3 differ at most at all the indices in $P_1[\gamma]$.

So we know H_3 and H'_1 differ at most at indices appear in P or P_1 , which is $\forall \gamma \in (dom(P) \cap P_1)$

 $dom(P_1)$). $\exists l_1, l_2, \tau, n.G(\gamma) = (l_1, l_2, \tau, n) \land \forall i < n.H_1[\gamma][i] \neq H'_1[\gamma][i] \implies i \in P[\gamma] \lor i \in P_1[\gamma]$. This subcase is proved because $i \in P[\gamma] \lor i \in P_1[\gamma] \implies i \in P[\gamma] \cup P_1[\gamma] \implies (P \sqcup P_1)[\gamma]$.

Also assume $v_4; H_3 \Downarrow_f^{c_5, k_5} v_5; H_2$ and $v_1'; H_1' \Downarrow_f^{c_2', k_2'} v_2'; H_2'$. We get: $H_2, H_2' \vDash_{G, k_6 - k_5} Q(l)$ and $(v_5, v_2') \in (\delta \tau)_{G, k_6 - k_5} (m)$ and $c_5 - c_2' \le \delta D'(n)$

From the forcing evaluation rule

$$\frac{\delta t_1 \Downarrow^{c_a,k_a} v \qquad v; H_1 \Downarrow^{c_3,k_3}_f v_a; H_3 \qquad t_2 \lfloor v_a/x \rfloor \Downarrow^{c_4,k_4} v_4 \qquad v_4; H_3 \Downarrow^{c_5,k_5}_f v_5; H_2}{ \det \{x\} = t_1 \text{ in } t_2; H_1 \Downarrow^{c_a+c_3+c_4+c_5+c_{\text{let}},k_a+k_3+k_4+k_5+1}_f v_5; H_2} \text{ F-E}$$

STS1 is proved by (l). STS2 is proved by (m) using Lemma 1. STS3 : $c_2 - c_2' = c_a + c_3 + c_4 + c_5 + c_{\text{let}} - c_2' \le \delta(U + U_1 + D' + (D_2 + U_2) + c_{\text{let}})$ by (e),(k),(n), (f).

$$\Sigma; \Delta; \Phi; |\Gamma|_2 \vdash_{L_1}^{U_1} t_1' : \{P_1\} \stackrel{\text{exec}(L,U)}{\exists \vec{\gamma}_1 : A_1'} \{Q_1\} \qquad \Sigma; \Delta; \Phi; |\Gamma|_1 \vdash_{L_2}^{U_2} t_2 : \{P_2\} \stackrel{\text{exec}(L',U')}{\exists \vec{\gamma}_1 : A_1} \{Q_2\} \stackrel{\text{diff}(D')}{= dom(P)} \\ \textbf{Case} \frac{dom(P) = dom(P_1) \qquad \Sigma; \Delta; \Phi; \Gamma, x : U(A_1', A_1') \vdash t_2 \ominus t_2' \lesssim D_2 : \{P \sqcup P_1\} \stackrel{\text{diff}(D')}{\exists \vec{\gamma}_1 . \tau'} \{Q\}}{\Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus \text{let} \{x\} = t_1' \text{ in } t_2' \lesssim U_2 : \qquad \{P\} \stackrel{\text{diff}(D' + (D_2 - L_2) - L_1 - L - c_{\text{let}})}{= t_2' } \\ \textbf{r-e-bind}$$

By assumption we have $\vdash \delta : \Delta, \models \delta \Phi$ and $(\sigma_1, \sigma_2) \in [\![\delta \Gamma]\!]_{G,k}$, we need to show:

$$(\delta\,\sigma_1\,t_2, \mathsf{let}\,\{x\} = (\delta\,\sigma_2\,t_1')\,\mathsf{in}\,(\delta\,\sigma_2\,t_2')) \in \big(\!\!\big| \begin{array}{c} \mathsf{diff}(\delta(D' + (D_2 - L_2) - L_1 - L - c_{\mathsf{let}})) \\ (P \mid \exists\vec{\gamma}_1.\delta\,\tau'\mid Q\} \end{array} \!\!\big)_{G,k,\delta\,U_2}^e$$

Unfold this definition, suppose the pure evaluation of $\delta \sigma_1 t_2$ of the form $\delta \sigma_1 t_2 \Downarrow^{c_1,k_1} v_1$, and the evaluation of the monadic bind of the form

(let
$$\{x\} = \delta \sigma_2 t_1'$$
 in $\delta \sigma_2 t_2'$) $\downarrow^{0,0}$ let $\{x\} = \delta \sigma_2 t_1'$ in $\delta \sigma_2 t_2'$

, we need to show:

1. $c_1 - 0 \le \delta U_2$.

2.
$$(v_1, (\text{let } \{x\} = (\delta \, \sigma_2 \, t_1') \text{ in } (\delta \, \sigma_2 \, t_2'))) \in (\![\delta(\{P\} \, \exists \vec{\gamma_1}.\delta \, \tau \, \{Q\} \,)\!])_{G,k-k_1}.$$

By Theorem **??** on the second premise Σ ; Δ ; Φ ; $|\Gamma|_1 \vdash_{L_2}^{U_2} t_2 : \{P_2\} \ \exists \vec{\gamma_1} : A_1 \ \{Q_2\}$, instantiated with $\sigma_1 \in [\![\delta|\Gamma|_1]\!]_{|G|_1,k}$ inferred from $(\sigma_1,\sigma_2) \in (\![\delta\Gamma]\!]_{G,k}$, and the index variable substitution δ . We conclude that:

$$\delta \, \sigma_1 \, t_2 \in \llbracket \{P_2\} \, \exists \vec{\gamma}_1 : \delta \, A_1 \, \{Q_2\} \rrbracket_{|G|_1,k,(\delta \, L_2,\delta \, U_2)}^e$$

, which we unfold we conclude that

$$\begin{aligned} & \operatorname{exec}(\delta L', \delta U') \\ v_1 \in [\![\{P_2\}\ \exists \vec{\gamma_1} : \delta \ A_1 \ \{Q_2\}]\!]_{|G|_1, k} \wedge \delta \ L_2 \leq c_1 \leq \delta \ U_2 \end{aligned}$$

, which show our first goal $c_1 - 0 \le \delta U_2$.

Then there is one thing left we need to show:

We unfold it definition, when are given arbitrary $G' \supseteq G$, $k' \le k - k_1$, heaps H, H' so that $H, H' \vDash_{G', k'} P$, suppose the forcing evaluation of v_1 and let $\{x\} = \delta \sigma_2 t'_1$ in $\delta \sigma_2 t'_2$ of the form:

$$v_1; H \downarrow_f^{c_2,k_2} v_2; H_2$$

$$\frac{\delta\,\sigma_{2}\,t_{1}'\,\!\!\!\!\downarrow^{c_{1}',k_{1}'}\,v'\quad v';H'\,\!\!\!\downarrow^{c_{2}',k_{2}'}_{f}\,v_{1}';H_{1}'\quad \delta\,\sigma_{2}\,t_{2}'[v_{1}',x]\,\!\!\!\downarrow^{c_{3}',k_{3}'}_{g}\,v_{2}'\quad v_{2}';H_{1}'\,\!\!\!\downarrow^{c_{4}',k_{4}'}_{f}\,v_{3}';H_{2}'}{\text{let}\,\{x\} = \delta\,\sigma_{2}\,t_{1}'\,\,\text{in}\,\delta\,\sigma_{2}\,t_{2}';H'\,\!\!\!\downarrow^{c_{1}'+c_{2}'+c_{3}'+c_{4}'+c_{\text{let}},k_{1}'+k_{2}'+k_{3}'+k_{4}'+1}_{f}\,v_{3}';H_{2}'}\,\,\textbf{f-bind}$$

, with $k_2 < k' \le k - k_1$. Now taking $G_2 = G'$, we must show:

- 1. $(H_2, H'_2) \vDash_{G', k'-k_2} Q$.
- 2. $(v_2, v_3') \in (\delta \tau)_{G', k'-k_2}$.
- 3. $c_2 (c_1' + c_2' + c_2' + c_1' + c_{let}) \le \delta(D' + (D_2 L_2) L_1 L c_{let})$.

By induction hypothesis using Theorem **??** on the first premise, instantiated with $\sigma_2 \in [\![\delta|\Gamma|_2]\!]_{G|_2,k}$ inferred from $(\sigma_1, \sigma_2) \in (\![\delta\Gamma]\!]_{G,k}$, and the index variable substitution δ . We can conclude that:

$$\delta \, \sigma_2 \, t_1' \in \llbracket (\{P_1\} \, \exists \vec{\gamma_1} : \delta \, A_1' \, \{Q_1\}) \rrbracket_{|G|_2,k',(\delta \, L_1,\delta \, U_1)}^e$$

, which we unwind to conclude:

$$\nu' \in \llbracket \{P_1\} \; \exists \vec{\gamma_1} : \delta \; A_1' \; \{Q_1\} \rrbracket_{|G|_2, k'-k_1'} \; \wedge \; \delta \, L_1 \leq c_1' \leq \delta \; U_1$$

, which we unfold its definition, taking $g_2 = |G|_2$, assume $H' \models_{g_2,k'}$ to conclude that

$$H_1' \vDash_{g_2,k'-k_2'} Q_1 \, \wedge \, v_1' \in [\![\delta \, A_1']\!]_{g_2,k'-k_2'} \, \wedge \, \delta \, L \leq c_2' \leq \delta \, U$$

From $v_1' \in [\![\delta A_1']\!]_{g_2,k'-k_2'}$, we conclude that:

$$(\sigma_1[v_1'/x], \sigma_2[v_1'/x]) \in (\delta(\Gamma, x : U(A_1', A_1')))_{G_2, k}$$

By induction hypothesis on the third premise instantiated with $(\sigma_1[\nu_1'/x], \sigma_2[\nu_1'/x]) \in (\delta(\Gamma, x : U(A_1', A_1')))_{G_2,k}$, we know that:

$$(\delta \sigma_1 \, t_2[\nu_1'/x], \delta \, \sigma_2 \, t_2'[\nu_1'/x]) \in \left(\{P \cup P_1\} \, \exists \vec{\gamma_1}.\delta \, \tau' \, \{Q\}\right)_{G_2,k,\delta D_2}^e$$

, which we unfold to conclude that

$$(\nu_1,\nu_2') \in \left(\{P \cup P_1\} \; \exists \vec{\gamma}_1.\delta \; \tau' \; \{Q\}\right)\right|_{G_2,k-k_1} \; \wedge \; c_1 - c_3' \leq \delta \; D_2$$

 $\operatorname{diff}(\delta D')$

. We unfold $(v_1, v_2') \in (P \cup P_1) \exists \vec{\gamma_1} . \delta \tau' \{Q\}) \setminus_{G_2, k-k_1}$, we can show that $(H, H_1') \models_{G', k'} P \sqcup P_1$ by the definition of the heap relation using the premise $dom(P) = dom(P_1)$. Then we can conclude that when taking $G_2 = G'$:

$$(v_2, v_3') \in (\delta \tau')_{G', k'-k_2} \land c_2 - c_4' \leq \delta D' \land (H_2, H_2') \models_{G', k'-k_2}$$

Now we can conclude that

- 1. $(H_2, H_2') \models_{G', k'-k_2} Q$. It is already proved by the previous conclusion.
- 2. $(v_2, v_3') \in (\delta \tau)_{G', k'-k_2}$. It is already proved by the previous conclusion.
- 3. $c_2 (c_1' + c_2' + c_3' + c_4' + c_{let}) \le \delta(D' + (D_2 L_2) L_1 L c_{let})$. It is proved by previous conclusions.

Proof of statement (2) if $\Delta; \Phi; \Omega \vdash_L^U t : A$ and $\vdash \delta : \Delta$ and $\vdash \delta \Phi$ and there exists Ω' . s.t. $FV(t) \subseteq dom(\Omega')$ and $\Omega' \subseteq \Omega$ and $(\sigma) \in (\delta \Omega')_{g,k}$. Then, $(\delta \sigma t) \in (A)_{g,k}^{E,(\delta L,\delta U)}$ Proof by induction on typing derivation:

CASE
$$\frac{\xi; \Delta; \Phi; x: A, f: \stackrel{\text{exec}(L,U)}{A} \xrightarrow{B}, \Omega \vdash_{L}^{U} t: B}{\Delta; \Phi; \Omega \vdash_{0}^{0} \text{fix} f(x). t: \stackrel{\text{exec}(L,U)}{A} \xrightarrow{B}} \text{ U-F}$$

Assume that $\vdash \delta : \Delta$ and $\models \delta \Phi$ and there exists Ω' . s.t. $FV(t) \subseteq dom(\Omega')$ and $\Omega' \subseteq \Omega$ and $(\sigma) \in (\delta \Omega')_{g,k}$

TS: $(\delta \sigma \operatorname{fix} f(x).t) \in [\![\delta A \xrightarrow{\operatorname{exec}(L,U)} B]\!]_{g,k}^{E,(0,0)}$. Because $\operatorname{fix} f(x).e$ is value.

STS: $(\delta \sigma \operatorname{fix} f(x).t) \in [\![\delta A \longrightarrow B]\!]_{g,k}$

We prove the more general statement $\forall k' \leq k.\delta\sigma(\operatorname{fix} f(x).t) \in [\![\delta A \longrightarrow \delta B]\!]_{g,k}(1).$ By sub-induction on k'. There are two cases:

subcase 1: k'=0. there is no non-negative k such that $k \le 0$, the goal is vacuously true.

subcase 2: $k' = k'' + 1 \le k$

By sub-IH, we know: $\delta \sigma(\operatorname{fix} f(x).t) \in [\![\delta A \longrightarrow \delta B]\!]_{g,k''}(2)$.

STS: $(\operatorname{fix} f(x).\delta\sigma e) \in [\![\delta A \longrightarrow \delta B]\!]_{g,k''+1}$. Pick j < k''+1 and assume that $v \in [\![\delta A]\!]_{g,j}$. STS: $\sigma[v/x][\operatorname{fix} f(x).e/f]) \in [\![\delta A]\!]_{g,j}$.

This follows by IH on the premise instantiated with

- 1. FV(e) $\subseteq dom(x:A,f:A \longrightarrow B,\Omega')$ from Lemma (well-formness) and $(x:A,f:A \longrightarrow B,\Omega') \subseteq (x:A,f:A \longrightarrow B,\Omega)$
- 2. $(\sigma[v/x][\operatorname{fix} f(x).t/f]) \in [\delta(x:A,f:A \longrightarrow B,\Omega')]_{g,j}$ which holds because
 - 2.1. $\sigma \in [\delta \Omega']_{g,j}$ by Lemma downward closure and $j < k'' + 1 \le k$
 - 2.2. $v \in [A]_{g,j}$ from assumption
 - 2.3. $(\delta \sigma \operatorname{fix} f(x).e) \in [\![\delta A \longrightarrow \delta B]\!]_{g,j}$ from Lemma 1 on (2).

This completes the proof of unary fix case.

$$\text{CASE} \ \frac{\Sigma; \Delta; \Phi; \Omega \vdash_{L_1}^{U_1} t_1 : \text{int}[I] \qquad \Sigma; \Delta; \Phi; \Omega \vdash_{L_2}^{U_2} t_2 : A \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi; \Omega \vdash_0^0 \text{alloc } t_1 \ t_2 : \{P\} \ \exists \gamma : \text{Array}_{\gamma}[I] \ A \ \{P \star \gamma \to \mathbb{N}\}} \quad \text{U-ALLOC}$$

Assume that $\vdash \delta : \Delta$ and $\models \delta \Phi$ and there exists Ω' . s.t. $FV(t) \subseteq dom(\Omega')$ and $\Omega' \subseteq \Omega$ and $(\sigma) \in (\delta \Omega')_{g,k}$

Assume that
$$\vdash \delta : \Delta$$
 and $\models \delta \Phi$ and there exists Ω' . s.t. FV
$$\operatorname{exec}(L_1 + L_2 + L_a, U_1 + U_2 + U_a)$$
$$\operatorname{TS:} (\delta \sigma \text{ alloc } t_1 \ t_2) \in [\{P\} \ \exists \gamma : \mathsf{Array}_{\gamma}[I] \ A \ \{P\gamma \to \mathbb{N}\}]_{g,k}^{E,(0,0)}$$

Because alloc t_1 t_2 is value. STS: $(\delta \sigma \text{ alloc } t_1$ $t_2) \in [\{P\} \exists \gamma : Array_{\gamma}[I] \ A \ \{P\gamma \to \mathbb{N}\}]_{g,k}$

 $H \vDash_{g',k'} P$ and H; alloc $t_1 t_2 \Downarrow^{k''}$.

From H; alloc $t_1 t_2 \downarrow^{k''}$, because t_1, t_2 are sub terms of $\delta \sigma$ alloc $t_1 t_2$, we get $\delta \sigma t_1 \Downarrow_f^{k_1} \land \delta \sigma t_2 \Downarrow_f^{k_2} (1)$. From

 $\exists v_1, v_2, k_1, k_2.\delta \sigma t_1 \Downarrow^{k_1, c_1} v_1 \wedge \delta \sigma t_2 \Downarrow^{k_2, c'_1} v_2 \wedge k'' = k_1 + k_2 + 1 \wedge c = c_1 + c'_1 + c_{alloc}(a).$

From (a) and evaluation rules we get: $\exists l.H$, (alloc $t_1 t_2$) $\delta \sigma \Downarrow_f^{k'',c} l$; $H[l \to [v_2, \dots v_2](b)$.

By IH on the first premise instantiated with $\sigma \in [\![\delta\Omega']\!]_{g,k''}$ using lemma 1 and $FV(t_1) \subseteq dom(\Omega')$ and

$$\begin{split} &\Omega'\subseteq\Omega, \text{ we get } (\delta\sigma\,t_1)\in [\![\inf_r[I]]\!]_{g',k''}^{E,(\delta L_1,\delta U_1)}(*).\\ &\text{Unfold the definition of } [\![\inf[I]]\!]_{g',k''}^{E,(\delta L_1,\delta U_1)} \text{ and using (a) and } k_1\leq k'', \text{ we know:} \end{split}$$

$$(v_1) \in [\text{int}[I]]_{G',k''-k_1} \Rightarrow v_1 = I \land \delta L_1 \le c_1 \le \delta U_1$$
 IH1

By IH on the second premise instantiated with $(\sigma) \in [\delta\Gamma]_{g',k'-k_1}$ using lemma 1 and $FV(t_2) \subseteq dom(\Omega')$ and $\Omega' \subseteq \Omega$, we get: $(\delta \sigma t_2) \in [\![\delta A]\!]_{g',k'-k_1}^{E,(\delta L_2,\delta U_2)}(**)$.

Unfold the definition of (**) and using (a), (b) and $k_2 \le k' - k_1$, we know

$$(\nu_2) \in [\![\delta A]\!]_{g',k'-k_1-k_2} = [\![\delta A]\!]_{g',k'-k''+1} \land \delta L_2 \le c'_1 \le \delta U_2$$
 IH2

Let us assume: $g'' = g'[r \to (l, A, I)](c)$, $H' = H, [l \to [v_2, v_2, ..., v_2]](d)$. We want to show 4 cases.

- **TS1** $(l) \in [Array_{\gamma}[I] A]_{g'',k'-k''}$ it is proved by unfolding the definition and using the assumption (c).
- **TS2** $(H') \vDash_{g'',k'-k''} p \star \gamma \to \mathbb{N}$ we know that $g''(\gamma) = (l, A, I), H' = H \uplus H_l \land H_l = l \to [\nu_2, \nu_2, ..., \nu_2]$

STS1 $\forall i \leq I, (H_l(l)[i] \in [A]_{g'',k'-k''-1}$. It is proved by using IH2 and Lemma 1.

- **TS3** $\delta(L_1 + L_2 + L_a) \le c \le \delta(U_1 + U_2 + U_a)$ It is proved by IH1 and IH2 and $\delta L_a \leq c_{alloc} \leq \delta U_a$.
- **TS4** $\exists n.P = \{\gamma_1 \to T_1, \dots, \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq H'[l_i][j] \Rightarrow j \in T_i \}$ Because new allocated γ is not in P, so for all the γ_i , it is not changed.

This proof is complete for case alloc.

By assumption we have $\vdash \delta : \Delta, \models \delta \Phi$ and $\sigma \in [\![\delta \Omega]\!]_{g,k}$, we need to show:

$$\mathsf{read}\; (\delta\,\sigma\,t_1)\; (\delta\,\sigma\,t_2) \in \llbracket \delta \overset{\mathsf{exec}(L_1 + L_2 + L_{\mathsf{read}}, U_1 + U_2 + U_{\mathsf{read}})}{\{P\}\; \exists_\; : \; A\; \{P\}} \rrbracket_{g, k, (0, 0)}^e.$$

Since read $(\delta \sigma t_1)$ $(\delta \sigma t_2)$ is a value, and its evaluation incurs no cost, it is sufficient to show:

$$\mathsf{read}\; (\delta\,\sigma\,t_1)\; (\delta\,\sigma\,t_2) \in \llbracket \delta \overset{\mathsf{exec}(L_1 + L_2 + L_{\mathsf{read}}, U_1 + U_2 + U_{\mathsf{read}})}{\{P\}\; \exists_\; : \; A\; \{P\}} \; \rrbracket_{g,k}$$

Unfold the definition, when we are given an arbitrary $k' \le k$, an arbitrary $g' \supseteq g$, an arbitrary heap H so that $H \vDash_{g',k'} P$, and suppose that the evaluation of (read $(\delta \sigma t_1)$ $(\delta \sigma t_2)$) has the following form

$$\frac{\delta \sigma t_1 \Downarrow^{c_1,k_1} l \quad \delta \sigma t_2 \Downarrow^{c_2,k_2} n_2 \quad H(l)[n] = v}{\text{read } (\delta \sigma t_1) \ (\delta \sigma t_2); H \Downarrow^{c_1+c_2+c_{\mathsf{read}},k_1+k_2+1} v; H} \mathbf{f}\text{-read}$$

with $k_1 + k_2 + 1 < k' \le k$. Now taking $g_2 = g'$ and $H_1 = H$, we must show that:

- 1. $\delta L_1 + \delta L_2 + \delta L_{\text{read}} \leq c_1 + c_2 + c_{\text{read}} \leq \delta U_1 + \delta U_2 + \delta U_{\text{read}}$.
- 2. $H \models_{g',k'-(k_1+k_2+1)} P$.
- 3. $v \in [\![\delta A]\!]_{g',k'-(k_1+k_2+1)}$.

$$4. \ \exists n.P = \{\gamma_1 \rightarrow T_1, \dots, \gamma_n \rightarrow T_n\} \ \land \ \forall i \in [1,n]. \\ g(\gamma_i) = (l_i,A,m) \Rightarrow \forall j. (H[l_i][j]) \neq H[l_i][j] \Rightarrow j \in T_i.$$

By induction hypothesis on the first premise $\Sigma; \Delta; \Phi; \Omega \vdash^{U_1}_{L_1} \delta \sigma \, t_1 : \mathsf{Array}_{\gamma}[I] \, A$, instantiated with $\sigma \in \llbracket \delta \Omega \rrbracket_{g',k'}$ inferred from our original assumption $\sigma \in \llbracket \delta \Omega \rrbracket_{g,k}$ by lemma 1, and the index variable substitution δ . We conclude that:

$$\delta \sigma t_1 \in [Array_{\gamma}[\delta I] (\delta A)]_{g',k',(\delta L_1,\delta U_1)}^e$$

, which we unfold its definition to conclude:

$$l \in [\![\mathsf{Array}_{\gamma}[\delta I]\ (\delta A)]\!]_{g',k'-k_1} \ \land \ \delta L_1 \le c_1 \le \delta U_1$$

, which in turn tell us: $g'(\gamma) = (l, \delta A, \delta I)$.

By induction hypothesis on the second premise $\Sigma; \Delta; \Phi; \Omega \vdash_{L_2}^{U_2} t_2 : \operatorname{int}[I']$, instantiated with $\sigma \in [\![\delta\Omega]\!]_{g',k'}$ and δ , we can conclude :

$$\delta \sigma t_2 \in [int[\delta I']]_{g',k',(\delta L_2,\delta U_2)}^e$$

, which we unfold to conclude that: $n_2 \in [\inf[\delta I']]_{g',k'-k_2}$, in turn tells us that

$$n_2 = \delta I' \wedge \delta L_2 \le c_2 \le \delta U_2$$

Now we can conclude as follows:

- 1. $\delta L_1 + \delta L_2 + \delta L_{\text{read}} \le c_1 + c_2 + c_{\text{read}} \le \delta U_1 + \delta U_2 + \delta U_{\text{read}}$, using the fact that $L_{\text{read}} \le c_{\text{read}} < U_{\text{read}}$ in our language and L_{read} and U_{read} are constants, which means $\delta L_{\text{read}} = L_{\text{read}}$ and $\delta U_{\text{read}} = U_{\text{read}}$.
- 2. $H \models_{g',k'-(k_1+k_2+1)} P$, which is proved by unfolding the definition of our assumption $H \models_{g',k'} P$.
- 3. $v \in [\![\delta A]\!]_{g',k'-(k_1+k_2+1)}$. From the heap relation $H \models_{g',k'} P$ and the premise $\gamma \in dom(P)$, we know $\forall i \leq n, (H_1(l)(i)) \in [\![A]\!]_{g',k'-1}$, which in turn tells us $v \in [\![A]\!]_{g',k'-1}$. We can then show our goal by using Lemma 1.
- 4. $\exists n.P = \{\gamma_1 \to T_1, \dots, \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq H[l_i][j] \Rightarrow j \in T_i$. Because the heap H is not changed, so the claim is trivial.

By assumption we have $\vdash \delta : \Delta$, $\models \delta \Phi$ and $\sigma \in [\![\delta \Omega]\!]_{g,k}$, we need to show:

$$\mathsf{updt}\; (\delta\,\sigma\,t_1)\; (\delta\,\sigma\,t_2)\; (\delta\,\sigma\,t_3) \in \llbracket \delta \quad \{P \star \gamma \to \beta\}\; \exists_: \mathsf{unit}\; \{P \star \gamma \to \beta\}\; \rrbracket_{g,k,(0,0)}^e$$

Since updt $(\delta \sigma t_1)$ $(\delta \sigma t_2)$ $(\delta \sigma t_3)$ is a value, it is sufficient to show:

$$\begin{array}{c} \operatorname{exec}(L_1 + L_2 + L_3 + L_{\operatorname{updt}}, U_1 + U_2 + U_3 + U_{\operatorname{updt}}) \\ \operatorname{updt} \left(\delta \, \sigma \, t_1\right) \left(\delta \, \sigma \, t_2\right) \left(\delta \, \sigma \, t_3\right) \in \left[\!\left[\delta \right] \left\{P \star \gamma \to \beta\right\}\right] = \\ : \operatorname{unit} \left\{P \star \gamma \to \beta\right\} \left[\!\left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\} \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\} \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\} \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\} \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \star \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \to \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \to \gamma \to \beta\right\}\right] \\ = \left[\int_{\mathbb{R}^n} \left\{P \to \gamma \to \beta\right\}\right] + \left[\int_{\mathbb{R}^n} \left\{P \to \gamma \to \beta\right\}\right]$$

Unfold the definition, when we are given an arbitrary $k' \le k$, an arbitrary $g' \supseteq g$, an arbitrary heap H so that $H \vDash_{g',k'} P \star \gamma \to \beta$, and suppose that the evaluation of (updt $(\delta \sigma t_1)$ $(\delta \sigma t_2)$ $(\delta \sigma t_3)$) has the following form

$$\frac{\delta \sigma \, t_1 \Downarrow^{c_1,k_1} l \quad \delta \sigma \, t_2 \Downarrow^{c_2,k_2} n \quad \delta \sigma \, t_3 \Downarrow^{c_3,k_3} v}{\mathsf{updt} \, (\delta \sigma \, t_1) \, (\delta \sigma \, t_2) \, (\delta \sigma \, t_3); H \Downarrow^{c_1+c_2+c_3+c_{\mathsf{update}},k_1+k_2+k_3+1}_f \, (); H(l)[n] \leftarrow v} \, \mathbf{f\text{-updt}}$$

With $k_1 + k_2 + k_3 + 1 < k'$. Now we take $g_2 = g'$ and $H_1 = H(l)[n] \leftarrow v$, we must show:

- 1. $\delta L_1 + \delta L_2 + \delta L_3 + \delta L_{updt} \le c_1 + c_2 + c_3 + c_{updt} \le \delta U_1 + \delta U_2 + \delta U_3 + \delta U_{updt}$.
- 2. $(H(l)[n] \leftarrow v) \models_{g',k'-(k_1+k_2+k_3+1)} P \star \gamma \rightarrow \beta$.
- 3. $v \in [\text{unit}]_{g',k'-(k_1+k_2+k_3+1)}$.
- 4. $\exists n.P \star \gamma \to \beta = \{\gamma_1 \to T_1, \dots, \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq (H(l)[n] \leftarrow v)[l_i][j] \Rightarrow j \in T_i.$

By induction hypothesis on the first premise $\Sigma; \Delta; \Phi; \Omega \vdash^{U_1}_{L_1} t_1 : \mathsf{Array}_{\gamma}[I] \ A$, instantiated with $\sigma \in \llbracket \delta \Omega \rrbracket_{g',k'}$ inferred from our original assumption $\sigma \in \llbracket \delta \Omega \rrbracket_{g,k}$ by lemma 1, and the index variable substitution δ . We conclude that:

$$\delta \sigma t_1 \in [Array_{\gamma}[\delta I] (\delta A)]_{g',k',\delta(\delta L_1,\delta U_1)}^e$$

, which we unwind to conclude that

$$l \in [Array_{\gamma}[\delta I] (\delta A)]_{g',k'-k_1} \Rightarrow g'(\gamma) = (l,\delta A,\delta I) \land \delta L_1 \leq c_1 \leq \delta U_1$$

By induction hypothesis on the second premise $\Sigma; \Delta; \Phi; \Omega \vdash_{L_2}^{U_2} t_2 : \text{int}[I']$, we conclude that

$$\delta \sigma t_2 \in [[int[\delta I]]]_{g',k',(\delta L_2,\delta U_2)}^e$$

, which we unfold its definition to conclude: $n \in [\inf[\delta I]]_{g',k'-k_2}$, in turn tells us that

$$n = I \wedge \delta L_2 \le c_2 \le \delta U_2$$

By induction hypothesis on the third premise $\Sigma; \Delta; \Phi; \Omega \vdash_{L_3}^{U_3} t_3 : A$, we conclude that:

$$\delta\,\sigma\,t_3\in [\![\delta\,A]\!]^e_{g',k',(\delta\,L_3,\delta\,U_3)}$$

, which we unwind to conclude that

$$v \in [\delta A]_{g',k'-k_3} \land \delta L_3 \leq c_1'' \leq \delta U_3$$

Now we can conclude as follows:

- 1. $\delta L_1 + \delta L_2 + \delta L_3 + \delta L_{\text{updt}} \le c_1 + c_2 + c_3 + c_{\text{updt}} \le \delta U_1 + \delta U_2 + \delta U_3 + \delta U_{\text{updt}}$, using the fact that $L_{\text{updt}} \le c_{\text{updt}} < U_{\text{updt}}$ in our language and L_{updt} and U_{updt} are constants , which means $\delta L_{\text{updt}} = L_{\text{updt}}$ and $\delta U_{\text{updt}} = U_{\text{updt}}$.
- 2. $(H(l)[n] \leftarrow v) \vDash_{g',k'-(k_1+k_2+k_3+1)} P \star \gamma \rightarrow \beta$. We conclude that $\forall i \leq I.H(l)[i] \in (\delta A)_{g',k'-1}$ by unfolding the definition of our assumption $H \vDash_{g',k'} P \star \gamma \rightarrow \beta$. Then we can prove that $\forall i \leq I.(H(l)[n] \leftarrow v)(l)[i] \in (\delta A)_{g',k'-(k_3+1)}$ because of the our previous conclusion $v \in [\delta A]_{g',k'-k_3}$. Then our goal can be proved by using the monotonicity lemma 1.
- 3. $v \in [\text{unit}]_{g',k'-(k_1+k_2+k_3+1)}$, which is proved by the definition of the interpretation of unit type.
- 4. $\exists n.P \star \gamma \to \beta = \{\gamma_1 \to T_1, \dots, \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq (H(l)[n] \leftarrow v)[l_i][j] \Rightarrow j \in T_i$. When $\gamma_i \neq \gamma$, the array is not changed so that $H[l_i] = (H(l)[n] \leftarrow v)[l_i]$. When $\gamma_i = \gamma$, then $T_i = \beta$, we can show that the only updated index n at this array H[l] is in β from our premise $\Delta; \Phi \models I' \in \beta$ in the rule, which proves this case.

This completes the proof of case unary update.

$$\text{CASE} \ \frac{\Sigma; \Delta; \Phi; \Omega \vdash_L^U t : A \qquad \Delta; \Phi; \Omega \vdash p \quad wf}{\Sigma; \Delta; \Phi; \Omega \vdash_0^0 \text{ return } t : \{P\} \ \exists \gamma. A \ \{P\}} \ \text{U-T}$$

Assume that $\vdash \delta : \Delta$ and $\models \delta \Phi$ and there exists Ω' . s.t. $FV(t) \subseteq dom(\Omega')$ and $\Omega' \subseteq \Omega$ and $(\sigma) \in (\delta \Omega')_{g,k}$ TS: $(\delta \sigma \text{ return } t) \in [\![\delta \{P\}]\!]_{g,k}^{\text{exec}(L,U)}$

Because return t is value. STS: $(\delta \sigma \operatorname{return} t) \in [\![\delta \{P\}]\!]_{g,k}$

Unfold the definition of $\llbracket \delta \{P\} \ \exists \gamma.A \ \{P\} \rrbracket_{g,k}$. Pick $g^{'} \supseteq g, \ H_1,k' \le k,k'' < k'$. Assume $H_1 \vDash_{g',k'} P(1),$ $H_1; \delta\sigma(\text{return } t) \downarrow_f^{k''}(2).$

Because t is the subterm of return t, From (2), We know: $\delta \sigma_1 t \downarrow^{k''}$ (3). From (3), we know:

$$\exists v_1, k_1, \delta \sigma_1 t \downarrow^{k_1, c_1} v_1 \wedge k'' = k_1 + 1 \wedge c = c_1 + c_{ret}$$
 (a)

From (a) and the evaluation rule **U-ret**: $\exists H'_1.H_1$; return $t \Downarrow_f^{k'',c} v_1; H'_1(b)$.

By IH on the premise instantiated with $(\sigma) \in [\![\delta\Omega']\!]_{g',k'}$ by lemma 1. We get: $(\delta\sigma t_1) \in [\![\delta A]\!]_{G',k'}^{E,\delta(L,U)}$ (5). Unfold (5), we get: $v_1 \in (\delta A)_{g',k'-k_1} \land \delta L_1 \le c_1 \le \delta U_1$ (6). Let us assume: g'' = g'(7), $H'_1 = H'_1(8)$.

STS1: $H'_1 \vDash_{g',k'-k''} P$. it is from assumption by using lemma 1.

STS2: $v_1 \in (\tau)_{g',k'-k''}$. It is proved by (6) using Lemma 1.

STS3: $\delta L \le c \le \delta U$ which is proved from (6)

STS4: $\exists n.P = \{\gamma_1 \rightarrow T_1, \dots, \gamma_n \rightarrow T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq H'[l_i][j] \Rightarrow j \in T_i$ H is not changed, it is trivial true.

This completes the proof of case unary return.

$$\begin{split} P &= P_1 \star P_2 \\ \frac{\Sigma; \Delta; \Phi; \Omega \vdash_{L_1}^{U_1} t : \{P_1\} \ \exists \vec{\gamma}_1 : A \ \{Q_1 \star Q_2\} \qquad \Sigma; \Delta, \vec{\gamma}_1; \Phi; \Omega, x : A \vdash_{L_2}^{U_2} u : \{Q_1 \star P_2\} \ \exists \vec{\gamma}_2 : B \ \{Q\}}{\Sigma; \Delta; \Phi; \Omega \vdash_{L_1 + L_2 + L_l}^{U_1 + U_2 + U_l} \text{let} \ \{x\} = t \text{ in } u : \{P\} \ \exists \vec{\gamma}_1, \vec{\gamma}_2 : B \ \{Q \star Q_2\} \end{split} } \ \text{U-E} \end{split}$$

Assume that $\vdash \delta : \Delta$ and $\models \delta \Phi$ and there exists Ω' . s.t. $FV(t) \subseteq dom(\Omega')$ and $\Omega' \subseteq \Omega$ and $(\sigma) \in (|\delta \Omega'|)_{\sigma,k}$

TS:
$$(\delta \sigma_1(\text{let } \{x\} = t_1 \text{ in } t_1')) \in (\delta \{P\} \exists \vec{\gamma_1}, \vec{\gamma_2} : B \{Q \star Q_2\}) \Big|_{\sigma k}^{(E,(U_1 + U_2, L_1 + L_2))}$$

TS: $(\delta \sigma_1(\text{let } \{x\} = t_1 \text{ in } t_1')) \in (\delta \{P\} \exists \vec{\gamma}_1, \vec{\gamma}_2 : B \{Q \star Q_2\}) (E, (U_1 + U_2, L_1 + L_2))$ Unfold the definition . Pick $g' \supseteq g$, $H_1, k' \le k$, k'' < k'. Assume $H_1 \vDash_{G', k'} P(1)$, $H_1; \delta \sigma_1(\text{let } \{x\} = t_1 \text{ in } t_1')$ $) \downarrow_{f}^{k''} (2).$

Because t_1 is the subterm of let $\{x\} = t_1$ in t_1' , From (2), we know: $\exists v_1, v_1', v_1'', v_1''', k_1, k_2, k_3, k_4, H_1', H_1''$. $\delta \sigma_1 t_1 \Downarrow^{k_1, c_1} v_1$ and $H_1; v_1 \Downarrow^{k_2, c_2}_f H_1'; v_1''$ and $\delta \sigma_1 t_1' [v_1'/x] \Downarrow^{k_3, c_3}_f v_1''$ and $H_1; v_1'' \Downarrow^{k_4, c_4}_f H_1''; v_1''', k'' = k_1 + k_2 + k_3 + k_4 + k_5 +$ $k_4 + 1 \wedge c = c_1 + c_2 + c_3 + c_4 + c_{let}(a)$.

From evaluation rule: E-Let-F and (a)(b), we know:

$$\exists H_a, H_c, H'_a, H1_{Q1}, H1_{Q2}, H1_Q, s.t. H_1 = H_a \uplus H_c \land v1; H_a \Downarrow_f v'_1; H'_a \land H'_a = H1_{Q1} \uplus H1_{Q2}$$
$$\land v''_1; H1_{Q1} \uplus H_c \Downarrow_f v'''_1; H1_Q \land H''_1 = H1_Q \uplus H1_{Q2}$$
(c)

From (1): $H \vDash_{g',k'} P_1 \star P_2$, we assume that $\exists g_a, g_b : (H_1 = H_a \uplus H_c) \ (g' = g_a \uplus g_c)$ and $(H_a) \vDash_{g_a,k'} H_a \uplus H_b$ P_1 and $(H_c) \models_{g_c,k'} P_2(*)$.

 $\text{STS1:} \ (H_1'') \vDash_{g'',k'-k''} Q \star Q_2. \ \text{STS2:} \ (v_1''') \in \left\|\delta B\right\|_{G'',k'-k''}. \ \text{STS3:} \ \delta(L+L') \leq c_f \leq \delta(U+U') \wedge \delta(L_1+L_2+L_{let}) \leq c_f \leq \delta(U+U') \wedge \delta(L_1+L_2+L_{let}) \leq c_f \leq \delta(U+U') \wedge \delta($ $c_p \leq \delta(U_1 + U_2 + U_{let}). \text{ STS4: } P = \gamma_i \rightarrow \beta_i \forall i.g''(\gamma_i) = (l_i, m, A) \rightarrow H_1(l_i)[n] \neq H_1''(l_i)[n] \Rightarrow n \in \beta_i.$

By IH on the second premise instantiated with $(\sigma_1) \in (\delta\Omega)_{g',k'}$, we know: $(\delta\sigma_1t_1) \in (\{P_1\} \exists \vec{\gamma}_1 : A \{Q_1 \star Q_2\})_{g',k'}^{E,(L_1,U_1)}$ (4). Unfold the definition ,use (a), we get:

$$(v_1) \in (\delta \{P_1\} \exists \vec{\gamma_1} : A \{Q_1 \star Q_2\}) |_{g',k'} \land L_1 \leq c_1 \leq U_1 \land P_1 = \gamma_i \to \beta_i \Rightarrow \forall i.g''(\gamma_i) = (l_i, m, A) \to H_1(l_i)[n] \neq H'_1(l_i)[n] \Rightarrow n \in \beta_i$$
 (e)

```
To unfold (e), we choose: k_f \leq k' - k_1 and k_f' < k_f and g_f \supseteq g' and (1),(a). We have (H_a \vDash_{g_f,k_f} P_1 \land H_a; v_1 \Downarrow_f \land H_b; v_2 \Downarrow_f. Unfold the definition, we get: H_a; v_1 \Downarrow_f^{c_2} H_a'; v_1' \land H_a' \vDash Q_1 \star Q_2. (v_1') \in (A)_{g',k'-k_1} \land \delta L \leq c_2 \leq \delta U(k). By IH on the third premise, we know: (\delta \sigma_1 v_1'') \in (\{Q_1 \star P_2\} \exists \vec{\gamma_1}.\delta B \{Q\})_{G',k'}^{E,\delta D_2}(5). Unfold the definition, we get: v_1 \in (\{Q_1 \star P_2\} \exists \vec{\gamma_1}.\tau_2 \{Q\})_{g',k'-k_1} \land l_2 \leq c_3 \leq U_2 \land Q_1 \uplus P_2 = \gamma_i \to \beta_i \Rightarrow \forall i.g''(\gamma_i) = (l_i,m,A) \to H_1'(l_i)[n] \neq H_1''(l_i)[n] \Rightarrow n \in \beta_i(f). We have (H_a') \vDash_{g_f,k_f} Q_1 \star Q_2 \Rightarrow H_1Q_1 \vDash Q_1 \land H_1Q_2 \vDash Q_2 \land H_c \vDash P_2. H_1Q_1 \uplus H_c; v_1''' \Downarrow_f. Unfold the definition (f), we get: H_1Q_1 \uplus H_c; v_1''' \Downarrow_f^{c_4} H_1Q_i; v_1''' \land H_1Q \vDash Q_i, (v_1''') \in (\delta B)_{g',k'-k_1} \land \delta L' \leq c_4 \leq \delta U'(g). STS1: Use Lemma 2, we know that H_1Q \uplus H_1Q_2 \vDash Q \star Q_2, which proves STS1. STS2: it is proved from (g). STS3: it is proved from (e),(k),(f),(g) and c = c_f + c_p \land c_f = c_2 + c_4 STS4: from (e),(f), we know all the n in P will appear in P_1 or Q_1 \uplus P_2. It is proved.
```

This completes the proof of Unary let.

Proof of statement (3) if $\Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau$ and $\vdash \delta : \Delta$ and $\vdash \delta \Phi$. Then for $i \in \{1,2\}$. if there exists Γ_i' s.t. $FV(e_i) \subseteq dom(\Gamma_i'), \Gamma_i' \subseteq \Gamma$ and $(\sigma_i) \in [\![|\delta\Gamma_i'|_i]\!]_{G|_i,k}$, then $\delta\sigma_i e_i \in [\![|\delta\tau|_i]\!]_{G|_i,k}^{E,(0,\infty)}$ Because it is similar for the two case, we only show the case when i=1.

$$\text{CASE} \frac{\Delta; \Phi; x : \tau_1, f : \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2, \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau_2}{\Delta; \Phi; \Gamma \vdash \mathsf{Fix} \, f(x). t_1 \ominus \mathsf{Fix} \, f(x). t_2 \lesssim 0 : \tau_1 \overset{\text{diff}(D)}{\longrightarrow} \tau_2} \, \mathsf{R}\text{-FIX}$$

Assume that $\models \Phi \delta$ and there exists Γ' s.t. $FV(\text{fix } f(x).t_1) \subseteq dom(\Gamma'), \Gamma' \subseteq \Gamma$ and $\sigma \in [\![|\delta \Gamma'|_1]\!]_{G_{[1...k]}}$.

TS:
$$(\operatorname{fix} f(x).\delta\sigma t_1) \in [(|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1)]_{G|_1,k}^{E,(0,\infty)}$$

By Lemma 31,STS: $(\text{fix } f(x).\delta\sigma t_1) \in [(|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1)]_{G|_1,k}$. We prove the more general statement:

$$\forall m' \le k.(\mathsf{fix}\,f(x).\delta\sigma\,t_1) \in [(|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1)]|_{G|_1,m} \tag{1}$$

By subinduction on m'. There are two cases.

subcase 1: m' = 0. there is no non-negative k' < 0, it is vacuously true.

subcase 2:
$$m' = m'' + 1 \le k$$

Exec $(0,\infty)$ By sub-IH: $(\text{fix } f(x).\delta\sigma t_1) \in [(|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1)]_{G|_1,m''}$. STS: $(\text{fix } f(x).\delta\sigma t_1) \in [(|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1)]_{G|_1,m''+1}$ Unfold the definition. Pick $j \leq m''+1$, $g' \supseteq G|_1$. Assume $v \in [|\delta\tau_1|_1]_{g',j}$, STS: $\delta\sigma t_1[v/x][\text{fix } f(x).t_1/f] \in [(|\delta\tau_1|_1)]_{g',j}$ $[\![|\delta\tau_2|_1]\!]_{g',j}^{E,(0,\infty)}$

By IH 3 on the premise instantiated with $\sigma[\nu/x]$ [fix $f(x).t_1/f$] $\in [\delta(x:|\tau_1|_1,f:|\delta\tau_1|_1 \longrightarrow |\delta\tau_2|_1,|\Gamma'|)]_{g',j}$ which holds because

- 1. $\sigma \in [|\delta\Gamma'|_1]|_{g',j}$ by Lemma 1.
- 2. $v \in [|\tau_1|_1]|_{g',j}$ from assumption.
- 3. $\operatorname{fix} f(x).t_1 \in \llbracket |\tau_1|_1 \xrightarrow{\operatorname{exec}(0,\infty)} |\tau_2|_1 \rrbracket_{g',j}$ by Lemma 1 on the sub-IH conclusion.

and premises: $FV(t_1) \subseteq dom(x:\tau_1, f:\tau_1 \xrightarrow{diff(D)} \tau_2, \Gamma')$ and $x:\tau_1, f:\tau_1 \xrightarrow{diff(D)} \tau_2, \Gamma' \subseteq x:\tau_1, f:\tau_1 \xrightarrow{diff(D)} \tau_2$

This proof is complete.

$$\text{CASE} \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \text{int}[I]}{\Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \tau} \frac{\gamma \text{ fresh}}{\text{diff}(D_1 + D_2)} \text{ALLOC} \\ \Delta; \Phi; \Gamma \vdash \text{alloc } t_1 \ t_2 \ominus \text{alloc } t_1' \ t_2' \lesssim 0 : \{P\} \ \exists \gamma. \ \text{Array}_{\gamma}[I] \ \tau \ \{P \star \gamma \to \mathbb{N}\}$$

Assume that $\vDash \Phi \delta$ and there exists Γ' s.t. $FV(alloc t_1 t_2) \subseteq dom(\Gamma')$, $\Gamma' \subseteq \Gamma$ and $\sigma \in [\![\delta \Gamma']_1]\!]_{G|_1,k}$

$$\text{exec}(0,\infty) \\ \text{TS: } \delta\sigma \text{ alloc } t_1 \, t_2 \in [\![|\delta(\{|P|_1\} \exists \gamma. \, \mathsf{Array}_{\gamma}[I] \, | \tau|_1 \, \{|P|_1 \star \gamma \to \mathbb{N}\})|_1]\!]_{G|_1,k}^{E,(0,\infty)} \\ \text{STS: } \delta\sigma \text{ alloc } t_1 \, t_2 \in [\![|\delta(\{|P|_1\} \exists \gamma. \, \mathsf{Array}_{\gamma}[I] \, | \tau|_1 \, \{|P|_1 \star \gamma \to \mathbb{N}\})|_1]\!]_{G|_1,k}$$

Unfold the definition. Pick $g' \supseteq G|_1, k' \le k, k'' < k'$ and assume $H \models_{g',k'} |P|_1$ and H; alloc $t_1 t_2 \bigcup_f^{k''} |P|_f$

STS:
$$H$$
; $v \downarrow_f^{k'',c} v'$, H' and $0 \le c \le \infty$ and $H' \vDash_{g'',k'-k''} \gamma$ and $v' \in [Array_{\gamma}[I] \mid \tau \mid_1]_{g'',k'-k''}$

From H; alloc $t_1 t_2 \Downarrow^{k''}$, because t_1, t_2 are sub terms of $\delta \sigma$ alloc $t_1 t_2$, we get: $\delta \sigma t_1 \Downarrow^{k_1}_f \land \delta \sigma t_2 \Downarrow^{k_2}_f (1)$. From (1), we get:

$$\exists v_1, v_2, k_1, k_2, \delta \sigma t_1 \Downarrow^{k_1, c_1} v_1 \wedge \delta \sigma t_2 \Downarrow^{k_2, c_1'} v_2 \wedge k'' = k_1 + k_2 + 1 \wedge c = c_1 + c_1' + c_{alloc}$$
 (a)

From (a) and evaluation rules we get: $\exists l.H$, (alloc $t_1 t_2$) $\delta \sigma \downarrow_f^{k'',c} l$; $H[l \rightarrow [v_2, \dots v_2](b)$.

By IH 3 on the first premise instantiated with $\sigma \in [|\delta\Gamma'|_1]|_{g,k''}$ using lemma 1 and $FV(t_1) \subseteq dom(\Gamma')$ and $\Gamma' \subseteq \Gamma$, we get: $(\delta \sigma t_1) \in [|\delta \operatorname{int}_r[I]|_1]_{g',k''}^{E,(0,\infty)}(*)$.

Unfold the definition of $[\inf[I]]_{g',k''}^{E,(0,\infty)}$ and using (a) and $k_1 \le k''$, we know:

$$(v_1) \in [[int[I]]]_{G',k''-k_1} \Rightarrow v_1 = I \land 0 \le c_1 \le \infty$$
 IH1

By IH 3 on the second premise instantiated with $(\sigma) \in [|\delta\Gamma'|_1]|_{g',k'-k_1}$ using lemma 1 and $FV(t_2) \subseteq dom(|\Gamma'|_1)$ and $\Gamma' \subseteq \Gamma$, we get: $(\delta \sigma t_2) \in [|\delta \tau|_1]_{g',k'-k_1}^{E,(0,\infty)}(**)$. Unfold the definition of (**) and using (a), (b) and $k_2 \le k' - k_1$, we know

$$(v_2) \in [\![\delta \tau|_1]\!]_{g',k'-k_1-k_2} = [\![\delta \tau|_1]\!]_{g',k'-k''+1} \land 0 \le c'_1 \le \infty$$
 IH2

Let us assume: $g'' = g'[\gamma \to (l, |\tau|_1, I)](c)$, $H'_1 = H_1, [l \to [v_2, v_2, ..., v_2]](d)$. We want to show 2 cases.

TS1 $(v' = l) \in [Array_{\gamma}[I] | \tau|_1]_{g'',k'-k''}$ it is proved by unfolding the definition and using the assumption (c).

TS2 $(H'_1) \vDash_{g'',k'-k''} |P|_1 \star \gamma \rightarrow \mathbb{N}$ we know that $g''(\gamma) = (l, |\tau|_1, I)$, $H'_1 = H_1 \uplus H_l \land H_l = l \to [v_2, ..., v_2], H_1 \vDash |P|_1$ from assumption. **STS1** $\forall i \leq I, (H_l(l)[i] \in [A]_{g'',k'-k''-1}$. It is proved by using IH2 and Lemma 1.

TS3 $0 \le c \le \infty$. It is proved by IH1 and IH2 and $0 \le c_{alloc} \le \infty$.

TS4: $\exists n. |P|_1 = \{\gamma_1 \to T_1, ..., \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq H'[l_i][j] \Rightarrow j \in T_i$ Because γ not in $|P|_1$. For all γ_i , H,H' is the same.

This proof is complete.

$$\text{CASE} \frac{\Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathsf{int}_r[I'] \qquad \Delta; \Phi \vDash I' \leq I}{\Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1' \ t_2' \lesssim 0 : \{P\} \ \exists_.\tau \ \{P\}} \, \frac{\mathsf{R}\text{-READ}}{\mathsf{R}\text{-READ}}$$

Assume that $\models \Phi \delta$ and there exists Γ' s.t. $FV(\text{read } t_1 \ t_2) \subseteq dom(\Gamma'), \Gamma' \subseteq \Gamma$ and $\sigma \in [\![\delta \Gamma']_1]\!]_{G|_1,k}$

TS: $\delta \sigma$ read $t_1 \ t_2 \in [|\delta(\{|P|_1\} \exists_-|\tau|_1 \{|P|_1\})|_1]|_{G_{|1},k}^{E,(0,\infty)}$

STS: $\delta \sigma$ read $t_1 \ t_2 \in [\![|\delta(\{|P|_1\} \exists _.|\tau|_1 \{|P|_1\})|_1]\!]_{G|_1,k}$ Unfold the definition. Pick $g' \supseteq G|_1, k' \le k, k'' < k'$ and assume $H \vDash_{g',k'} |P|_1$ and H; read $t_1 \ t_2 \Downarrow_f^{k''}$

STS: H; read t_1 $t_2 \bigvee_{f}^{k'',c} v'$, H' and $0 \le c \le \infty$ and $H' \vDash_{g'',k'-k''} \gamma$ and $v' \in \llbracket |\tau|_1 \rrbracket_{g'',k'-k''}$

From H; read $t_1 t_2 \Downarrow^{k''}$, because t_1, t_2 are sub terms of $\delta \sigma$ read $t_1 t_2$, we get: $\delta \sigma t_1 \Downarrow^{k_1}_f \land \delta \sigma t_2 \Downarrow^{k_2}_f$ (1). From (1), we get:

$$\exists l, n, v, k_1, k_2. \delta \sigma t_1 \Downarrow^{k_1, c_1} l \wedge \delta \sigma t_2 \Downarrow^{k_2, c'_1} n \wedge k'' = k_1 + k_2 + 1 \wedge c = c_1 + c'_1 + c_{read} \wedge H(l)[n] = v \qquad \text{(a)}$$

From (a) and evaluation rules we get: $H; \delta\sigma(\text{read }t_1\ t_2) \Downarrow_f^{k'',c} H; \nu\ (b).$

By IH 3 on the first premise instantiated with $\sigma \in [|\delta\Gamma'|_1]_{g,k''}$ using lemma 1 and $FV(t_1) \subseteq dom(\Gamma')$ and $\Gamma' \subseteq \Gamma$, we get: $(\delta \sigma t_1) \in [Array_{\gamma}[I] \mid \tau \mid_1]_{g',k'}^{E,(0,\infty)}(6)$.

Unfold (6), since $k_1 \leq k'$ and $\delta \sigma_1 t_1 \downarrow^{k_1,c_1} l$, we know $l \in [Array_{\gamma}[I] \mid \tau \mid_1]_{g',k'-k_1} \land 0 \leq c_1 \leq \infty(e)$. From (e), we know: $g'(\gamma) = (l, |\tau|_1, I)(7)$.

By IH 3 on the first premise instantiated with $\sigma \in [\![|\delta\Gamma'|_1]\!]_{g,k''}$ using lemma 1 and $FV(t_2) \subseteq dom(\Gamma')$ and $\Gamma' \subseteq \Gamma$, we get: $(\delta \sigma_1 t_2') \in [[int[I']]]_{g',k'}^{E,(0,\infty)}(8)$. Unfold (8), since $k_2 \le k'$, we know

$$n \in [[int[I']]]_{g',k'-k_2} \Rightarrow n = I' \land 0 \le c_1' \le \infty$$
 (f)

Let us assume: g' = g'(g).

STS1: $H \vDash_{g',k'-k''} |P|_1$. It is proved by Lemma 1 on assumption $H \vDash_{g',k'} |P|_1$

STS2: $(v' = v) \in [\![|\tau|_1]\!]_{g',k'-k''}$

from (a). we know $H_1(l)[n] = v$. From $H \models_{g',k'-k''} \gamma$, we know: $\forall i \leq n, (H_1(l)(i)) \in [\![A]\!]_{g',k'-1}$. s.t we know $(H_1(l)[n]) \in [A]_{g',k'-1}$. Because $k' - k'' \le k' - 1$, By Lemma 1, We get: $v \in [A]_{g',k'-k''}$

STS3: $0 \le c \le \infty$. Proved by the fact that $0 \le c_{read} \le \infty$, it is proved by (e)(f).

STS4: $\exists n. |P|_1 = \{\gamma_1 \to T_1, ..., \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq H'[l_i][j] \Rightarrow j \in T_i$ H is not changed, it is trivially true.

This completes the proof of case read.

$$\text{CASE} \ \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathsf{int}[I'] \qquad \Delta; \Phi \models I' \leq I \qquad \Delta; \Phi \models I' \in \beta}{\Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1' \ t_2' \lesssim 0 : \{\gamma \to \beta\} \ \exists ... \Box \tau \ \{\gamma \to \beta\}} \ \text{R-RB}$$

The proof is same as case read above.

$$\text{CASE} \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathsf{int}[I']} \underbrace{\Sigma; \Delta; \Phi; \Gamma \vdash t_3 \ominus t_3' \lesssim D_3 : \tau}_{\text{CSS}} \underbrace{\Delta; \Phi \vdash I' \leq I}_{\text{R-U}} \underset{\Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{updt} \ t_1 \ t_2 \ t_3 \ominus \mathsf{updt} \ t_1' \ t_2' \ t_3' \lesssim 0 : \{P \star \gamma \to \beta\} \ \exists_: \mathsf{unit}_r \ \{P \star \gamma \to \beta \cup \{I'\}\}}_{\text{R-U}}$$

Assume that $\models \Phi \delta$ and there exists Γ' s.t. $FV(\mathsf{updt}\ t_1\ t_2\ t_3) \subseteq dom(\Gamma')$, $\Gamma' \subseteq \Gamma$ and $\sigma \in [\![\delta \Gamma']_1]\!]_{G|_1,k}$

TS:
$$\delta \sigma$$
 updt t_1 t_2 $t_3 \in [|\delta(\{|P|_1 \star \gamma \to \mathbb{N}\})] = \sup_{q \in \mathcal{N}} \frac{\exp((0,\infty)}{|q|_1} |\{|P|_1 \star \gamma \to \mathbb{N}\})|_1$

STS: $\delta \sigma$ updt t_1 t_2 $t_3 \in [|\delta(\{|P|_1 \star \gamma \to \mathbb{N}\} \exists _. | \text{unit}_r|_1 \{|P|_1 \star \gamma \to \mathbb{N}\})|_1]|_{G|_1,k}$ Unfold the definition.

Pick $g' \supseteq G|_1, k' \le k, k'' < k'$ and assume $H \vDash_{g',k'} |P|_i \star \gamma \to \mathbb{N}$ and H; updt $t_1 \ t_2 \ t_3 \downarrow_f^{k''}$

STS: H; updt t_1 t_2 $t_3 \Downarrow_f^{k'',c}$ v', H' and $0 \le c \le \infty$ and $H' \vDash_{g'',k'-k''} \gamma$ and $v' \in \llbracket |\text{unit}_r|_1 \rrbracket_{g'',k'-k''}$

From H; updt t_1 t_2 t_3 $\Downarrow^{k''}$, because t_1, t_2 are sub terms of $\delta \sigma$ updt t_1 t_2 t_3 , we get: $\delta \sigma t_1 \Downarrow^{k_1}_f \land \delta \sigma t_2 \Downarrow^{k_2}_f$ $\wedge \delta \sigma t_3 \downarrow_f^{k_3}$ (1). From (1), we get:

$$\exists l, n, \nu, k_1, k_2, k_3. \delta \sigma t_1 \Downarrow^{k_1, c_1} l \wedge \delta \sigma t_2 \Downarrow^{k_2, c'_1} n \wedge \delta \sigma t_3 \Downarrow^{k_3, c''_1} \nu \wedge k'' = k_1 + k_2 + k_3 + 1 \wedge c = c_1 + c'_1 + c''_1 + c_{update}$$
 (a)

From (a) and evaluation rules we get:H; $\delta\sigma(\operatorname{updt}\ t_1\ t_2\ t_3)$ $\Downarrow_f^{k'',c}\ H[l][n]\leftarrow v$; ()(b). By IH 3 on the first premise instantiated with $\sigma\in [\![\delta\Gamma']_1]\!]_{g,k''}$ using lemma 1 and $FV(t_2)\subseteq dom(\Gamma')$ and $\Gamma' \subseteq \Gamma$, we get: $(\delta \sigma t_1) \in \llbracket \mathsf{Array}_{\gamma}[I] \ | \tau|_1 \rrbracket_{G',k'}^{E,(0,\infty)}(2).$

Similarly, By IH 3 on the second premise and third premise, we get: $(\delta \sigma t_2) \in [|\inf[I]|_1]_{\sigma',k'}^{E,(0,\infty)}(3)$, $(\delta \sigma t_3) \in [\inf[I]|_1]_{\sigma',k'}^{E,(0,\infty)}(3)$ $[|\tau|_1]_{g',k'}^{E,(0,\infty)}$ (4). From (2),(3),(4), we know:

$$l \in [Array_{\gamma}[I] \ A]_{g',k'-k_1} \Rightarrow g'(\gamma) = (l,A,I) \land 0 \le c_1 \le \infty$$
 (c)

$$n \in \llbracket \operatorname{int}[I] \rrbracket_{g,k'-k_2} \Rightarrow n = I \land 0 \le c_1' \le \infty \tag{d}$$

$$v \in [A]_{g',k'-k_3} \land 0 \le c_1'' \le \infty$$
 (e)

Let us assume: g'' = g'(5), $H'_1 = H(l)[n] \leftarrow v(6)$.

$$\begin{split} \textbf{STS1:} \ \ (H_1') &\models_{g',k'-k''} |P|_1 \star \gamma \to \mathbb{N} \\ H_1 &= H_p \uplus H_l, \ H_1' = H_p \uplus H_l(l) \leftarrow \nu, \text{From assumption } H_1 \vDash |P|_1 \star \gamma \to \mathbb{N} \\ \text{STS:} \ H_l' &= H_l(l) \leftarrow \nu \vDash \gamma \to \mathbb{N}, \text{ which is proved by the assumption that } H_l \vDash \gamma \to \mathbb{N} \,. \end{split}$$

STS2: $(0) \in [\text{unit}]_{g',k'-k''}$. It is proved by unfolding the definition.

STS3: $0 \le c \le \infty$. by the fact that $\delta L_u \le c_{update} \le \delta U_u$, it is proved by (c)(d)(e).

STS4: $\exists n. |P|_i \star \gamma \to \mathbb{N} = \{\gamma_1 \to T_1, \dots, \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq H'[l_i][j] \Rightarrow j \in T_i$

When $l_i \neq l$, the heap is not changed. it is true;

When $l_i = l$, $H(l)[n] \neq H'(l)[n]$, To show $n \in \beta$, which the premise in the typing rule.

This completes the proof of case unary update.

$$\text{CASE} \ \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash \text{return } t_1 \ominus \text{return } t_2 \lesssim 0 : \{P\} \ \exists_{-}.\tau \ \{P\}} \ \text{R-T}$$

Assume that $\vDash \Phi \delta$ and there exists Γ' s.t. $\mathrm{FV}(\mathrm{return}\ t_1) \subseteq dom(\Gamma')$, $\Gamma' \subseteq \Gamma$ and $\sigma \in [\![\delta \Gamma']_1]\!]_{G|_1,k}$

 $\text{TS: } \delta\sigma \text{ return } t_1 \in [\![|\delta(\{|P|_1\} \exists _.|\tau|_1 \, \{|P|_1\})|_1]\!]_{G|_1,k}^{E,(0,\infty)}$

STS: $\delta \sigma$ return $t_1 \in [\delta(\{|P|_1\} \exists \bot |\tau|_1 \{|P|_1\})]_{B_{1},k}$

Unfold the definition. Pick $g' \supseteq G|_1, k' \le k, k'' < k'$ and assume $H \models_{g',k'} |P|_1$ and H; return $t_1 \downarrow_f^{k''}$

 $\text{STS: } H; \text{return } t_1 \Downarrow_f^{k'',c} v', H' \text{ and } 0 \leq c \leq \infty \text{ and } H' \vDash_{g'',k'-k''} \gamma \text{ and } v' \in \llbracket |\tau|_1 \rrbracket_{g'',k'-k''}$

Because t_1 is the subterm of return t_1 , we know: $\delta \sigma_1 t_1 \downarrow^{k''}$ (3). From (3), we know:

$$\exists v_1, k_1, \delta \sigma_1 t_1 \Downarrow^{k_1, c_1} v_1 \wedge k'' = k_1 + 1 \wedge c = c_1 + c_{ret}$$
 (a)

From (a),(b) and the evaluation rule **R-ret**: H_1 ; return $t_1 \Downarrow_f^{k'',c} v_1; H_1(b)$.

By IH 3 on the first premise instantiated with $\sigma \in \llbracket |\delta\Gamma'|_1 \rrbracket_{g,k''}^{j'}$ using lemma 1 and $FV(t_2) \subseteq dom(\Gamma')$ and $\Gamma' \subseteq \Gamma$, we get: $(\delta\sigma t_1) \in \llbracket |\delta\tau|_1 \rrbracket_{G',k'}^{E,(0,\infty)}(5)$.

Unfold (5), we get: $v_1 \in (\delta A)_{g',k'-k_1} \land 0 \le c_1 \le \infty$ (6). Let us assume: g'' = g'(7) $H'_1 = H_1(8)$.

STS1: $H_1 \vDash_{g',k'-k''} |P|_1$. It is proved by the assumption on Lemma (monotonicity).

STS2: $(v_1) \in (|\tau|_1)_{g',k'-k''}$. It is proved by (6) using Lemma 1.

STS3: $0 \le c \le \infty$ which is proved from (6)

STS4: $\exists n.|P|_1 = \{\gamma_1 \to T_1, \dots, \gamma_n \to T_n\} \land \forall i \in [1, n]. g(\gamma_i) = (l_i, A, m) \Rightarrow \forall j. (H[l_i][j]) \neq H'[l_i][j] \Rightarrow j \in T_i$ H is not changed, it is true.

This completes the proof of case unary return.

3 Example revisited

3.1 InPlaceMap

Example 1: In Place Map

```
InPlaceMap = fix map (f).\lambda a.\lambda k.\lambda n.

if k \le n then (let \{x\} = (\text{read } a \ k) in let\{\_\} = (\text{updt } a \ k \ (f \ x)) in ((celim (map f)) a \ (k+1) \ n) else return()
```

As a first example we want to prove

$$\vdash \quad \mathsf{InPlaceMap} \quad : \quad \begin{array}{c} \overset{\mathsf{exec}(L,U)}{\forall L. \forall U : \mathbb{N}. (A \longrightarrow A') \longrightarrow \forall n : \mathbb{N}. \ \forall i : \mathbb{N}. \ \forall \gamma : \mathbb{L}.} \\ & \overset{\mathsf{exec}((L+c_r+c_u)*(n-i), (U+c_r+c_u)*(n-i))}{(i \leq n) \supset \left(\mathsf{Array}_{\gamma}[n] \ A \longrightarrow \mathsf{int}[i] \longrightarrow \begin{cases} \gamma \to \mathbb{N} \end{cases} \exists_\mathsf{unit} \ \{\gamma \to \mathbb{N} \} \end{cases}} \right)$$

where c_r is the cost for one reading operation and c_u denotes the cost for one updating operation.//

$$\vdash \mathsf{InPlaceMap} \ominus \mathsf{InPlaceMap} \lesssim 0: \begin{array}{c} \forall r. \Box (\tau \overset{\mathsf{diff}(r)}{\longrightarrow} \tau) \longrightarrow \forall n, i : \mathbb{N}. \ \forall \gamma : \mathsf{ref.} \ \forall \beta : \mathbb{P}. \\ \forall i : \exists n : \exists (i \leq n) \Rightarrow (\mathsf{Array}_{\gamma}[n] \ \tau \longrightarrow \mathsf{int}[i] \longrightarrow \{\gamma \rightarrow \beta\} \ \exists_.\mathsf{unit} \ \{\gamma \rightarrow \beta\} \) \end{array}$$

$$\vdash \mathsf{InPlaceMap} \ominus \mathsf{InPlaceMap} \lesssim 0: \\ \begin{cases} \forall r. (\tau \overset{\mathsf{diff}(r)}{\longrightarrow} \tau) \longrightarrow \forall n, i : \mathbb{N}. \ \forall \gamma : \mathsf{ref.} \ \forall \beta : \mathbb{P}. \ (i \leq n) \supset \\ & \qquad \qquad \mathsf{diff}(((n-i)*r)) \\ \left(\mathsf{Array}_{\gamma}[n] \ \tau \longrightarrow \mathsf{int}[i] \longrightarrow \{\gamma \to \beta\} \ \exists_\mathsf{unit} \ \{\gamma \to \beta \cup [i,n]\} \ \right) \end{cases}$$

Let us call M the following term: $\left(\operatorname{celim}(\operatorname{\mathsf{map}} f) a(k+1) n\right)$. and call T the following term: $\left(\operatorname{\mathsf{let}} \{x\} = \left(\operatorname{\mathsf{read}} a k\right)\operatorname{\mathsf{in}} \operatorname{\mathsf{let}}_{-}\right\} = \left(\operatorname{\mathsf{updt}} a i (f x)\right)\operatorname{\mathsf{in}} \left(\operatorname{\mathsf{celim}}(\operatorname{\mathsf{map}} f) a(k+1) n\right)\right)$.

and call Z the following term: let{ $}$ = (updt a i (f x)) in(celim(map f) a (k + 1) n). and set V as: if k < n, then T else (return ()).

Before we discussing the two types, we can apply simple rules first to make the relational type easy to read. We apply R-iLam and R-abs several times. Before we start to derivate the relational type of part V, We apply relational rule R-Cimpl to introduce the constraint $i \le n$ into the constraint environment Φ .

Type 1: Same function We have two possible cases, one is that position $I \in \beta$ which means the values in the two arrays of two runs may be different, the other case is $I \notin \beta$, which means in index I, the values are the same in the two arrays:

Before we go to the two cases, we will first apply R-split. We need to show two cases and their types, with different constraint environment $\Phi \land i \in \beta$ and $\Phi \land i \notin \beta$ respectively.

Case 1: different values from read, $\Phi \land i \in \beta$

$$\frac{\Delta; \Phi; \Gamma \vdash a \ominus a \lesssim 0 : \operatorname{Array}_{\gamma}[n] \ \tau \qquad \Delta; \Phi; \Gamma \vdash k \ominus k \lesssim 0 : \operatorname{int}[i]}{\Delta; \Phi \models i \leq n \qquad \Delta; \vdash \operatorname{empty} \quad wf} \\ \frac{\Delta; \Phi \models i \leq n \qquad \Delta; \vdash \operatorname{empty} \quad wf}{\Delta; \Phi; \Gamma \vdash \operatorname{read} \ a \ k \ominus \operatorname{read} \ a \ k \lesssim 0 : \{\gamma \to \beta\} \ \exists_.\tau \ \{\gamma \to \beta\}} \\ \text{$\exists_.\tau \ \{\gamma \to \beta\}$}$$

and

 R-CASE

Using R-Let rules, we get

$$P_2 = \mathsf{empty} \qquad \Delta; \Phi; \Gamma \vdash \mathsf{read} \ a \ k \ominus \mathsf{read} \ a \ k \lesssim 0 : \{ \gamma \to \beta \} \stackrel{\mathsf{diff}(0)}{\exists_-: \mathsf{int}} \{ \gamma \to \beta \} \\ \frac{\Delta; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{ \gamma \to \beta \} \ \exists_-: \mathsf{unit}_r \ \{ \gamma \to \beta \}}{\Delta; \Phi; \Gamma, \{ x : \mathsf{int} \} \vdash T \ominus T \lesssim 0 : \{ \gamma \to \beta \} \ \exists_-: \mathsf{unit}_r \ \{ \gamma \to \beta \}} \xrightarrow{\mathsf{R-LET}} \\ \frac{\Delta; \Phi; \Gamma, \{ x : \mathsf{int} \} \vdash T \ominus T \lesssim 0 : \{ \gamma \to \beta \} \ \exists_-: \mathsf{unit}_r \ \{ \gamma \to \beta \}}{\exists_-: \mathsf{unit}_r \ \{ \gamma \to \beta \}}$$

$$P_2 = \mathsf{empty} \qquad \Delta; \Phi; \Gamma \vdash \mathsf{updt} \ a \ k \ (f \ x) \ominus \mathsf{updt} \ a \ k \ (f \ x) \lesssim 0 : \{\gamma \to \beta\} \ \exists_: \mathsf{unit}_r \ \{\gamma \to \beta\}$$

$$\frac{\mathsf{diff}(|\beta \cap [i+1,n]| * r)}{\Delta; \Phi; \Gamma \vdash M \ominus M \lesssim 0 : \{\gamma \to \beta\} \ \exists_: \mathsf{unit}_r \ \{\gamma \to \beta\}}$$

$$\frac{\mathsf{diff}(|\beta \cap [i+1,n]| * r)}{\mathsf{diff}(|\beta \cap [i+1,n]| * r + r)}$$

$$\Delta; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma \to \beta\} \ \exists_: \mathsf{unit}_r \ \{\gamma \to \beta\}$$
 R-LET

Because i in β , we know: $|\beta \cap [i+1, n]| * r + r = |\beta \cap [i, n]|$ and $\beta \cup \{i\} = \beta$. We want to show the typing of M. By applying R-IApp (when instantiating $\forall i$, we use i+1) and R-App(when instantiating $\lambda . k$, we use k+1), we can easily get

$$\begin{split} & \qquad \qquad \Delta; \Phi \vDash i+1 \leq n \qquad \Delta; \Phi \Gamma \vdash ((\mathsf{map}\,f)\big) \ominus ((\mathsf{map}\,f)\big) \lesssim 0: \\ & \qquad \qquad \underbrace{(i+1 \leq n) \supset \big(\mathsf{Array}_{\gamma}[n] \; \tau \longrightarrow \mathsf{int}[i+1] \longrightarrow \mathsf{int}[n] \longrightarrow \{\gamma \to \beta\} \; \exists_: \mathsf{unit} \; \{\gamma \to \beta\} \, \big)}_{\qquad \qquad \Delta; \Phi; \Gamma \vdash (\mathsf{celim}(\mathsf{map}\,f)\big) \ominus (\mathsf{celim}(\mathsf{map}\,f)\big) \lesssim 0: \\ & \qquad \qquad \qquad \underbrace{\mathsf{diff}(|\beta \cap [i+1,n]| * r)}_{\qquad \qquad \mathsf{diff}(|\beta \cap [i+1,n]| * r)}_{\qquad \qquad \mathsf{Array}_{\gamma}[n] \; \tau \to \mathsf{int}[i+1] \to \mathsf{int}[n] \to \{\gamma \to \beta\} \; \exists_: \mathsf{unit}_{r} \; \{\gamma \to \beta\} \end{split}$$

$$\Delta; \Phi; \Gamma \vdash (\mathsf{celim}(\mathsf{map}\,f)\,a\,(k+1)\,n\big) \ominus (\mathsf{celim}(\mathsf{map}\,f)\,a\,(k+1)\,n\big) \lesssim 0: \quad \inf_{\{\gamma \,\rightarrow \,\beta\}} \frac{\mathrm{diff}(|\beta \cap [i+1,n]| * r)}{\exists \bot : \mathsf{unit}_r \; \{\gamma \,\rightarrow \,\beta\}}$$

Case 2: the same value from read, $\Phi \wedge i \not\in \beta$

$$\begin{array}{c} \Delta; \Phi; \Gamma \vdash a \ominus a \lesssim 0 : \mathsf{Array}_{\gamma}[n] \ \tau \\ \Delta; \Phi; \Gamma \vdash k \ominus k \lesssim 0 : \mathsf{int}[i] \qquad \Delta; \Phi \models i \leq n \qquad \Delta; \Phi \models i \not\in \beta \\ \Delta; \Phi; \Gamma \vdash \mathsf{read} \ a \ k \ominus \mathsf{read} \ a \ k \lesssim 0 : \{\gamma \to \beta\} \ \exists_. \Box \tau \ \{\gamma \to \beta\} \end{array}_{\mathsf{R-RB}}$$

and

$$\Delta; \Phi; \Gamma \vdash a \ominus a \lesssim 0 : \operatorname{Array}_{\gamma}[n] \ \tau \qquad \Delta; \Phi; \Gamma \vdash k \ominus k \lesssim 0 : \operatorname{int}[i]$$

$$\Delta; \Phi \models \Box(\tau^{\operatorname{diff}((\sigma))}, \tau) \sqsubseteq \Box \tau^{\operatorname{diff}((0))} \tau \text{ s-R-BOX-DIFF}$$

$$\Delta; \Phi \vdash f \ominus f \lesssim 0 : \Box \tau^{\operatorname{diff}((0))} \tau$$

$$\Delta; \Phi; \Gamma x : \Box \tau \vdash f \ x \ominus f \ x \lesssim 0 : \Box \tau \qquad \Delta; \Phi \models i \leq n$$
R-UF

 $\Delta; \Phi; \Gamma, \vdash \text{ updt } a \ k \ (f \ x) \ominus \text{ updt } a \ k \ (f \ x) \lesssim 0 : \{\gamma \to \beta\} \ \exists_: \text{unit}_r \ \{\gamma \to \beta/\{i\}\}$

where $\Delta = n : \mathbb{N}, i : \mathbb{N}, r : \mathbb{R}$

$$\begin{split} \Sigma &= \gamma : \mathbb{L}, \Phi = i \leq n, \Gamma = a : \mathsf{Array}_{\gamma}[n] \ \tau, k : \mathsf{int}[i], f : \Box(\tau \xrightarrow{\mathsf{diff}((r))} \tau), map : \Box(\tau \xrightarrow{\mathsf{diff}(0)} \tau) \xrightarrow{\mathsf{diff}(0)} \forall n : \mathbb{N}. \ \forall i : \mathbb{N}. \ \forall \gamma, \beta : \ldots \\ & (i \leq n) \supset \left(\mathsf{Array}_{\gamma}[n] \ \tau \longrightarrow \mathsf{int}[i] \longrightarrow \mathsf{int}[n] \longrightarrow \exists \beta. \ \{ \gamma \to \beta \} \ \mathsf{unit} \ \{ \gamma \to \beta \} \right). \\ \mathsf{Because} \ \mathsf{at} \ \mathsf{position} \ \mathsf{i}, \ a_1[i] \neq a_2[i], \mathsf{s.t.} \ \beta \cup \{i\} = \beta. \\ \mathsf{Using} \ \mathsf{R-Let} \ \mathsf{rules}, \ \mathsf{we} \ \mathsf{get} \end{split}$$

$$P_2 = \mathsf{empty} \qquad \Delta; \Phi; \Gamma \vdash \mathsf{read} \ a \ k \ominus \mathsf{read} \ a \ k \odot : \{ \gamma \to \beta \} \ \exists_ : \mathsf{int} \ \{ \gamma \to \beta \}$$

$$R\text{-LET}$$

 $P_2 = \mathsf{empty} \qquad \Delta; \Phi; \Gamma \vdash \mathsf{updt} \ a \ k \ (f \ x) \ominus \mathsf{updt} \ a \ k \ (f \ x) \lesssim 0 : \{\gamma \to \beta\} \ \exists_{-} : \mathsf{unit}_r \ \{\gamma \to \beta\}$ $\Delta; \Phi; \Gamma \vdash M \ominus M \lesssim 0 : \{\gamma \to \beta\} \ \exists_{-} : \mathsf{unit}_r \ \{\gamma \to \beta\}$ $\Delta; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma \to \beta\} \ \exists_{-} : \mathsf{unit}_r \ \{\gamma \to \beta\}$ $\Delta; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma \to \beta\} \ \exists_{-} : \mathsf{unit}_r \ \{\gamma \to \beta\}$

Because i not in β , we know: $|\beta \cap [i+1, n]| * r + 0 = |\beta \cap [i, n]|$. The type of M is the same as we showed in previous case.

Type 2: Different functions:

$$\vdash \mathsf{InPlaceMap} \ominus \mathsf{InPlaceMap} \lesssim 0: \\ \forall r : \mathbb{N}. (\overset{\mathsf{diff}((r))}{\tau}) \longrightarrow \forall n : \mathbb{N}. \ \forall i : \mathbb{N}. \ \forall \gamma : \mathbb{L}. \ \forall \beta : \mathbb{P}. \\ \overset{\mathsf{diff}(((n-i)*r))}{(i \leq n)} \supset \left(\mathsf{Array}_{\gamma}[n] \ \tau \longrightarrow \mathsf{int}[i] \longrightarrow \{\gamma \to \beta\} \ \mathsf{unit} \ \{\gamma \to \beta \cup [i,n]\} \right)$$

Let start with read and update from index k.

$$\frac{\Delta; \Phi; \Gamma \vdash a \ominus a \lesssim 0 : \mathsf{Array}_{\gamma}[n] \ \tau}{\Delta; \Phi; \Gamma \vdash k \ominus k \lesssim 0 : \mathsf{int}[i] \qquad \Delta; \Phi \vDash i \leq n \qquad \Delta; \vdash \mathsf{empty} \quad wf}{\Delta; \Phi; \Gamma \vdash \mathsf{read} \ a \ k \ominus \mathsf{read} \ a \ k \lesssim 0 : \{\gamma \to \beta\}} \stackrel{\mathsf{diff}(0)}{\exists _. \tau} \ \{\gamma \to \beta\}$$

and

$$\frac{\Delta;\Phi;\Gamma\vdash a\ominus a\lesssim 0:\operatorname{Array}_{\gamma}[n]\;\tau}{\Delta;\Phi;\Gamma\vdash k\ominus k\lesssim 0:\operatorname{int}[i]} \frac{\Delta;\Phi;\Gamma,x:\tau\vdash f\;x\ominus f\;x\lesssim r:\tau}{\Delta;\Phi;\Gamma,x:\tau\vdash f\;x\ominus f\;x\lesssim r:\tau} \frac{\Delta;\Phi\models i\leq n}{\Delta;\Phi\models i\leq n} \frac{\Delta;\vdash \mathsf{empty}\;\;wf}{\Delta;\Phi;\Gamma\vdash \mathsf{updt}\;a\;k\;(f\;x)\ominus \mathsf{updt}\;a\;k\;(f\;x)\lesssim 0:\{\gamma\to\beta\}\;\exists_:\mathsf{unit}_r\;\{\gamma\to\beta\cup\{i\}\}}$$

where $\Delta = n : \mathbb{N}, i : \mathbb{N}, r : \mathbb{R}$ $\Sigma = \gamma : \mathbb{L}, \Phi = i \le n, \Gamma = a : \operatorname{Array}_{\gamma}[n] \tau, k : \operatorname{int}[i], f : (\tau \xrightarrow{\operatorname{diff}((r))} \tau),$ $map : (\tau \xrightarrow{\text{diff}((r))} \tau) \to \forall n, i, \gamma, \beta. (i \le n) \supset \Big(\operatorname{Array}_{\gamma}[n] \ \tau \to \operatorname{int}[i] \to \operatorname{int}[n] \ \{ \gamma \to \beta \} \ \operatorname{unit} \ \{ \gamma \to \beta \cup [i, n] \} \Big).$ We will show:

S-RM

$$\frac{\operatorname{diff}(0)}{\exists \text{diff}(0)} = \{ \gamma \to \beta \} \exists \text{diff}(|\beta \cap [i,n]| * r) \\ = \{ \gamma \to \beta \} \exists \text{diff}(0) \\ \Delta; \Phi; \Gamma \vdash \operatorname{return} () \ominus \operatorname{return} () \lesssim 0 : \{ \gamma \to \beta \} \exists \text{diff}(0) \\ \Delta; \Phi; \Gamma \vdash \operatorname{return} () \ominus \operatorname{return} () \lesssim 0 : \{ \gamma \to \beta \} \exists \text{diff}(|\beta \cap [i,n]| * r) \\ \Delta; \Phi; \Gamma \vdash \operatorname{return} () \ominus \operatorname{return} () \lesssim 0 : \{ \gamma \to \beta \} \exists \text{diff}(|\beta \cap [i,n]| * r) \\ \Delta; \Phi; \Gamma \vdash k < n \ominus k < n \lesssim 0 : \operatorname{unit} + \operatorname{unit} \qquad \Delta; \Phi; \Gamma \vdash T \ominus T \lesssim 0 : \{ \gamma \to S \} \exists \text{diff}(|\beta \cap [i,n]| * r) \\ \Delta; \Phi; \Gamma, \{ x : \tau \} \vdash V \ominus V \lesssim 0 : \{ \gamma \to \beta \} \exists \text{diff}(|\beta \cap [i,n]| * r) \\ \exists \text{diff}(|\beta \cap [i,n]|$$

Using R-Let rules, instantiate P_1 with $\{\gamma \to \beta\}$ and $P_2 = \text{empty}$, $Q = \{\gamma \to \beta \cup [i, n]\}$, we get

$$\begin{array}{l} \Delta; \Phi; \Gamma \vdash \mathsf{read} \; a \; k \ominus \mathsf{read} \; a \; k \lesssim 0 : \{ \gamma \to \beta \} \; \exists_ : \mathsf{int} \; \{ \gamma \to \beta \} \\ \frac{\Delta; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{ \gamma \to \beta \} \; \exists_ : \mathsf{unit}_r \; \{ \gamma \to \beta \cup [i, n] \} }{\mathsf{diff}(|\beta \cap [i, n]| * r)} \\ \Delta; \Phi; \Gamma, \{ x : \mathsf{int} \} \vdash T \ominus T \lesssim 0 : \{ \gamma \to \beta \} \; \exists_ : \mathsf{unit}_r \; \{ \gamma \to \beta \cup [i, n] \} \end{array}$$
 R-LET

Because we know: $(\beta \cup \{i\}) \cap [i+1, n] = \beta \cap [i+1, n]$ and $\beta \cup \{i\} \cup [i+1, n] = \beta \cup [i, n]$. Using R-Let rules, instantiate P_1 with $\{\gamma \to \beta\}$ and $P_2 = \text{empty}$, $Q_1 = \{\gamma \to \beta \cup \{i\}\}$, $Q_2 = \text{empty}$, Q = empty, $Q = \text{emp$ $\{\gamma \rightarrow \beta \cup \{i\} \cup [i+1, n]\}$, we get

$$\begin{split} \Delta; \Phi; \Gamma \vdash \mathsf{updt} \ a \ k \ (f \ x) & \ominus \mathsf{updt} \ a \ k \ (f \ x) \lesssim 0 : \{\gamma \to \beta\} \ \exists_: \mathsf{unit}_r \ \{\gamma \to \beta \cup \{i\}\} \\ & \underbrace{\Delta; \Phi; \Gamma \vdash M \ominus M \lesssim 0 : \{\gamma \to \beta \cup \{i\}\} \ \exists_: \mathsf{unit}_r \ \{\gamma \to \beta \cup \{i\} \cup [i+1,n]\}^* }_{\mathsf{diff}(|\beta \cap [i+1,n]| * r + r)} \\ & \underbrace{\Delta; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma \to S\} \ \exists_: \mathsf{unit}_r \ \{\gamma \to \beta \cup [i,n]\}}_{\mathsf{R-LET}} \end{split}$$

We want to show the typing of M. By applying R - IApp, instantiating β with $\beta \cup \{i\}$ and i with i+1. Then apply R-App (instantiating k with k+1) several times, we can easily get

 $\Delta; \Phi; \Gamma \vdash (\text{celim}(\text{map } f) \ a(k+1) \ n) \ominus (\text{celim}(\text{map } f) \ a(k+1) \ n) \leq 0 : \{\gamma \rightarrow \beta \cup \{i\}\} \ \exists : \text{unit}_{\Gamma} \ \{\gamma \rightarrow \beta \cup [i, n]\}$

When apply **R-Celim**, We also check the constraint $i + 1 \le n$.

3.2 MergeSort

Type 1: copy $S \cap [l, u] = \emptyset$

$$\forall n, L, U, \gamma_1, \gamma_2, S, S'. \ L \leq U \leq n \land S' \cap [L, U] = \emptyset \supset \\ \mathsf{Array}_{\gamma_1}[n] \ U(\mathsf{int}, \mathsf{int}) \to \mathsf{Array}_{\gamma_2}[n] \ U(\mathsf{int}, \mathsf{int}) \\ \to \mathsf{int}[L] \to \mathsf{int}[U] \to \{\gamma_1 \to S, \gamma_2 \to S'\} \ \exists_\mathsf{unit} \ \{\gamma_1 \to S, \gamma_2 \to \mathbb{N}\}$$

$$L = (c_r + c_r + c_u) * \min(l_e - l_s, r_e - r_s) + (c_r + c_u) * \max(l_e - l_r, r_e - e_s)$$

$$U = (c_r + c_r + c_u) * ((l_e - l_s) + (r_e - r_s))$$

 $((\text{celim} \, \text{mg} \, () \, (k+1)) \, a \, l_s \, l_e \, (r_s+1) \, r_e \, b))$

else (return())

In merge_{lp}, we have 4 positions in the input array, l_s , l_e indicating the left part of the array, r_s , r_e for right part. we need to merge the two part, which means total $(l_e - l_s)$ elements for left part of the input array and $(r_e - r_s)$ elements for right part. In the body of $merge_{lp}$, for every element to be merged and added to the buffer array, there are two possible different branches: in one branch (if $l_s < l_e \land r_s < r_e$, which means we still have elements waiting to be merged in both left and right parts), the cost will be $c_r + c_r + c_u$, c_r for the cost of read from the input array, c_u for the cost of updating the buffer array. in

the other branch, (either $l_s < l_e$ or $r_s < r_e$, we need to only merge one part into buffer array), the cost is $c_r + c_u$.

For the L, the minimal possible cost is that we run out the shorter part $(min(l_e - l_s, r_e - r_s))$ with the cost of $c_r + c_r + c_u$ first and then merge the rest part with the cost of $c_r + c_u$. For the maximal cost, merge all the elements with the cost of $c_r + c_r + c_u$. If we consider the cost for update as 1 unit cost and cost for read is 1 unit cost, $c_r + c_r + c_u = 3$, $c_r + c_u = 2$.

Type 1: mergeLp $S \cap [K, r_e] = \emptyset$

$$\forall n, l_s, l_e, r_s, r_e, K, \gamma, \gamma'. l_s \leq l_e \leq r_s \leq r_e \leq n \land S \cap [K, r_e] = \emptyset \\ \supset \operatorname{unit}_r \to \operatorname{int}[K] \to \operatorname{Array}_\gamma[n] \ U(\operatorname{int}, \operatorname{int}) \to \operatorname{int}[l_s] \to \operatorname{int}[l_e] \to \operatorname{int}[r_s] \\ \vdash \operatorname{merge}_{lp} \ominus \operatorname{merge}_{lp} \lesssim 0: \quad \to \operatorname{int}[r_e] \to \operatorname{Array}_{\gamma'}[n] \ U(\operatorname{int}, \operatorname{int}) \\ \stackrel{\operatorname{diff}(0)}{\to \{\gamma \to S, \gamma' \to \mathbb{N}\}} \ \exists_\operatorname{unit} \ \{\gamma \to S, \gamma' \to \mathbb{N} \land [l, u]\}$$

Because in the range $[K, r_e]$, all the values in the two arrays are exact the same, the two programs will go to the same branch for every step.

In the read rule, i equals to either l_s or r_s .

$$\frac{\Delta; \Phi; \Gamma \vdash a \ominus a \lesssim 0 : \mathsf{Array}_{\gamma}[n] \ \tau}{\Delta; \Phi; \Gamma \vdash l_s[r_s] \ominus l_s[r_s] \lesssim 0 : \mathsf{int}[i] \qquad \Delta; \Phi \models i \leq n \qquad \Delta; \Phi \vdash \mathsf{empty} \quad wf}{\Delta; \Phi; \Gamma \vdash \mathsf{read} \ a \ l_s[r_s] \ominus \mathsf{read} \ a \ l_s[r_s] \lesssim 0 : \{\gamma \to S\} \ \exists_.\tau \ \{\gamma \to S\}} \xrightarrow{\mathsf{R-R}}$$

and

$$\frac{\Delta; \Phi; \Gamma \vdash b \ominus b \lesssim 0 : \mathsf{Array}_{\gamma'}[n] \; \tau}{\Delta; \Phi; \Gamma \vdash k \ominus k \lesssim 0 : \mathsf{int}[i] \qquad \Delta; \Phi; \Gamma, x : \tau \vdash x \ominus x \lesssim 0 : \mathsf{int} \qquad \Delta; \Phi \models i \leq n \qquad \Delta; \Phi \vdash \mathsf{empty} \quad wf}_{\text{R-U}} \\ \Delta; \Phi; \Gamma \vdash \mathsf{updt} \; b \; k \; x[y] \ominus \mathsf{updt} \; b \; k \; x[y] \lesssim 0 : \{\gamma' \to N\} \; \exists_: \mathsf{unit}_r \; \{\gamma' \to N \cup [i]\}$$

Using R-Case for two times, we have four similar cases, we will have a look at one of them.

$$\Delta$$
; Φ ; Γ \vdash (celim(mg()) k + 1 a (l_s + 1) l_e r_s r_s \ominus (celim(mg()) k + 1 a (l_s + 1) l_e r_s r_s \lesssim 0:

Its type is $\{\gamma \to S, \gamma' \to N\}$ \exists : unit_r $\{\gamma \to S, \gamma' \to N\}$. By applying R-Celim to check the constraint and then applying R-Iapp and R-App for several times.

Type 2: mergeLp $S \cap [K, r_e] \neq \emptyset$

Because if $S \cap [K, r_e] \neq \emptyset$, $merge_{lp}$ in the two runs are likely to go into different branches at any step, We will use **R-S** to handle this cases because the two runs are likely to go to different branches in every step.

$$\Delta; \Phi; |\Gamma|_1 \vdash_0^0 \operatorname{merge}_{|p}() \ k \ a \ l_s \ l_e \ r_s \ r_e \ b : \{\gamma \to \emptyset, \gamma' \to [K, r_e]\} \ \exists_: \operatorname{unit} \ \{\gamma, \gamma'\} \\ \xrightarrow{exec(L,U)} \\ \Delta; \Phi; |\Gamma|_2 \vdash_0^0 \operatorname{merge}_{|p}() \ k \ a \ l_s \ l_e \ r_s \ r_e \ b : \{\gamma \to \emptyset, \gamma' \to [K, r_e]\} \ \exists_: \operatorname{unit} \ \{\gamma, \gamma'\} \\ \xrightarrow{exec(L,U)} \\ \Delta; \Phi; \Gamma \vdash \operatorname{merge}_{|p}() \ k \ a \ l_s \ l_e \ r_s \ r_e \ b \ominus \operatorname{merge}_{|p}() \ k \ a \ l_s \ l_e \ r_s \ r_e \ b \lesssim 0 : \\ \xrightarrow{exec(L,U)} \\ U(\{\gamma \to \emptyset, \gamma' \to [K, r_e]\} \ \exists_: \operatorname{unit} \ \{\gamma, \gamma'\})$$
 R-S

and we know from S-RUM.

$$\models U(\{\gamma, \gamma' \to [K, r_e]\} \; \exists_: \text{unit} \; \{\gamma, \gamma'\}, \{\gamma, \gamma' \to [L, U]\} \; \exists_: \text{unit} \; \{\gamma, \gamma'\}) \sqsubseteq \\ \{\gamma \to S, \gamma' \to S'\} \; \exists_: \text{unit}_r \; \{\gamma \to S, \gamma' \to S' \cup [K, r_e]\}$$

```

If we simplify the relative cost for M, it is $max((\lfloor (u-l)/2 \rfloor), u-l-(\lfloor (u-l)/2 \rfloor)+1) = \lceil \frac{u-l}{2} \rceil$. Let us look at the simplified version of msort:

```
msort(in,l,u,buf) = msort(in,l,l+\lfloor\frac{u-l}{2}\rfloor,buf);\\ msort(in,l+\lfloor\frac{u-l}{2}\rfloor+1,u,buf);\\ merge(in,l,l+\lfloor\frac{u-l}{2}\rfloor+1,u,buf). To show: Q(\lfloor\frac{u-l}{2}\rfloor+1,|S\cap[l,l+\lfloor\frac{u-l}{2}\rfloor]|)+\\ Q(u-l-\lfloor\frac{u-l}{2}\rfloor,|S\cap[l+\lfloor\frac{u-l}{2}\rfloor+1,u]|)+\lceil\frac{u-l}{2}\rceil\\ \leq Q(u-l+1,|S\cap[l,u]|) Let us simplify the inequality with n=l-u, \alpha=|S\cap[l,l+\lfloor\frac{u-l}{2}\rfloor] and \beta=|S\cap[l+\lfloor\frac{u-l}{2}\rfloor+1,u]|: \lceil\frac{n}{2}\rceil+Q(\lfloor\frac{n}{2}\rfloor,\alpha)+Q(\lceil\frac{n}{2}\rceil,\beta)\leq Q(n,\alpha+\beta), \text{ it is arithmetically tautology}\\ \alpha+\beta\neq 0 \text{ because } S\cap[l,u]\neq\emptyset
```

3.3 Naive String Search

Description: Given a long text string S: Array $_{\gamma_1}[N]$ int and a shorter substring W: Array $_{\gamma_2}[M]$ int to be searched in S. There is an int array P: Array $_{\gamma_3}[N]$ int which will store the matching result (1 as match, 0 as mismatch) for the same index as the text string. For example, for index 1, there is a match with W from index 1 in the text string S and P[1] = 1.

Helper function

Helper function will do the match process for one index m in s and update p[m], i will start from 0 till the length of w (Q) if the prefix matches.

$$\begin{array}{c} \operatorname{unit} \to \forall \gamma_1, \gamma_2, \gamma_3 : \mathbb{L}. \forall I, M, Q, N : \mathbb{N}. (I < Q < N \land M + I < N) \supset \operatorname{Array}_{\gamma_1}[N] \text{ int} \to \\ \mapsto \operatorname{search} : & \operatorname{Array}_{\gamma_2}[Q] \operatorname{int} \to \operatorname{int}[M] \to \operatorname{int}[I] \to \operatorname{int}[Q] \to \operatorname{Array}_{\gamma_3}[N] \operatorname{int} \to \\ & \operatorname{exec}(c_u + r, (Q - I) * r + c_u) \\ & \{\gamma_1 \to \emptyset, \gamma_2 \to \emptyset, \gamma_3 \to \{M\}\} \ \exists _. \operatorname{unit} \ \{\gamma_1 \to \emptyset, \gamma_2 \to \emptyset, \gamma_3 \to \{M\}\} \end{array}$$

Notice, one thing to mention is that in the unary type, in the precondition, $\gamma_3 \to \{M\}$, it means before helper is executed, it can only touch position M in p.

Where r is the cost of two reads and c_u is the cost for update, w has length Q, s, p have length N.

$$\begin{aligned} & \text{unit}_r \to \forall \gamma_1, \gamma_2, \gamma_3 : \mathbb{L}. \forall I, M, Q, N : \mathbb{N}. \forall \beta_2, \beta_3. (I < Q < N \land M + I < N) \subset \mathsf{Array}_{\gamma_1}[N] \text{ int} \\ \vdash \mathsf{search} \ominus \mathsf{search} \lesssim 0 : & \overset{\longrightarrow}{\mathsf{Array}_{\gamma_2}[Q]} \inf \to \inf[M] \to \inf[I] \to \inf[N] \to \inf[Q] \to \mathsf{Array}_{\gamma_3}[N] \inf \to \\ & \overset{\longrightarrow}{\mathsf{diff}((Q-1-\min(MIN(\beta_2\cap[I,\infty)),Q-1))*r)} \\ & \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \; \exists_. \text{unit} \; \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \end{aligned}$$

where MIN(beta:set) return the minimum element in the set beta.

First, we will apply rule R-Fix-Ext.

$$\operatorname{Set} \sigma = \operatorname{unit} \to \forall \gamma_1, \cdots \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists \underline{-}.\operatorname{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\}.$$

$$\operatorname{Set} A_1 = A_2 = \operatorname{unit} \to \forall \gamma_1 \gamma_2, \gamma_3 : \mathbb{L}. \forall I, M, Q, N : \mathbb{N}. (I < Q < N \land M + I < N) \supset \operatorname{Array}_{\gamma_1}[N] \text{ int} \to \operatorname{exec}(c_u, (Q - I - 1) * r + c_u)$$

$$\operatorname{Array}_{\gamma_2}[Q] \text{ int} \to \operatorname{int}[M] \to \operatorname{int}[I] \to \operatorname{int}[Q] \to \operatorname{Array}_{\gamma_3}[N] \text{ int} \to \{\gamma_3 \to \{M\}\} \exists \underline{-}.\operatorname{unit} \{\gamma_3 \to \{M\}\} .$$

$$\operatorname{Set} \Gamma = \underline{-}: \operatorname{unit}, f: \operatorname{unit} \longrightarrow \sigma, f U(A_1, A_2)$$

$$\begin{split} \frac{\Gamma \vdash \Lambda \lambda s..... \ominus \Lambda \lambda s..... \lesssim 0 : \sigma}{|\Gamma|_1 \vdash_0^0 \mathsf{Fix} f(\underline{}).\Lambda \lambda s....: A_1 \qquad |\Gamma|_2 \vdash_0^0 \mathsf{Fix} f(\underline{}).\Lambda \lambda s....: A_2}{\Gamma \vdash \mathsf{Fix} f(\underline{}).\Lambda \ominus \mathsf{Fix} f(\underline{}).\Lambda \lesssim 0 : \mathsf{unit} \xrightarrow{\mathsf{diff}(0)} \sigma} \,_{\mathsf{R-FIX-EXT}} \end{split}$$

We first show how do we get the unary type A_1 .

Set $A_1 = \text{unit} \rightarrow B_1$. So $B_1 = \forall \gamma_1 \gamma_2, \gamma_3 : \mathbb{L} \dots$, Set $\Omega = |\Gamma|_1 = \underline{} : \text{unit}, f : A_1$.

unary type

First, we apply U-fix rule.

$$\frac{\Omega \vdash_0^0 \Lambda.....\lambda S....: B_1}{\Omega \vdash_0^0 \operatorname{Fix} f(_).\Lambda....: A_1} \text{ U-FIX}$$

Then, we apply rule U-ILam several times to introduce new index term into sort environment Δ . Set $\Delta = \gamma_1 : \mathbb{L}, \gamma_2 : \mathbb{L}, \gamma_2 : \mathbb{L}, I : \mathbb{N}, M : \mathbb{N}, N : \mathbb{N}, Q : \mathbb{N}$.

To introduce the constraint, apply U-CIMPL. $\Phi = (I < Q < N \land M + I < N)$.

Apply U-Abs several times to eliminate all the lambdas, we introduce variables into the unary context, $\Omega = s : Array_{\gamma_1}[N]$ int, $w : Array_{\gamma_2}[Q]$ int, m : int[M], i : int[I], $l_w : int[Q]$, $p : Array_{\gamma_3}[N]$ int . we will show:

$$\begin{split} \{\gamma_3 \to \{M\}\} &= \{\gamma_3 \to \{M\}\} \star \mathsf{empty} & \vdash_0^0 \mathsf{read} s \; (m+i) : \{\gamma_3 \to \{M\}\} \; \exists _\mathsf{int} \; \{\gamma_3 \to \{M\}\} \\ & \Delta; \Phi; a : \mathsf{int}, \Omega \vdash_0^0 \mathsf{let} \{b\} = \mathsf{read} \; b \; (i) \cdots : \{\gamma_3 \to \{M\}\} \; \exists _\mathsf{int} \; \{\gamma_3 \to \{M\}\} \\ & \Delta; \Phi; \Omega \vdash \mathsf{let} \{a\} = \mathsf{read} \; s \; (m+i) \ldots : \{\gamma_3 \to \{M\}\} \; \exists _\mathsf{unit} \; \{\gamma_3 \to \{M\}\} \end{split} \quad \text{U-LET}$$

We apply U-Let again to introduce b into the unary environment. Set $\Omega' = a$: int, b: int, Ω . We need to show the unary type of the first if term.

$$\Delta; \Phi; \Omega' \vdash_0^0 \text{ if } (a == b)(1) : \{ \gamma_3 \to \{M\} \} \text{ } \exists_. \text{int } \{ \gamma_3 \to \mathbb{N} \}$$

$$\underbrace{\Delta; \Phi; \Omega' \vdash_0^0 \text{ if } (a == b)(2) : \{ \gamma_3 \to \{M\} \} \text{ } \exists_. \text{int } \{ \gamma_3 \to \mathbb{N} \} }_{\text{exec}(c_u, (Q-I-1)*r+c_u)} + \underbrace{\{ \alpha_i \in \mathcal{N} : \{ \alpha_i \in$$

For if (2):

Along with the constraint $I + 1 < Q < N \land M + I + 1 < N$.

For the other branch, the term updt p m 0. We use **U-X** and subtyping rule **S-A-MONAD**.

$$\Delta;\Phi;\Omega'\vdash_0^0\mathsf{updt}\;p\;m\;0:\{\gamma_3\to\{M\}\}\;\exists_.\mathsf{int}\;\{\gamma_3\to\{M\}\}\\ \triangleq \mathsf{exec}(c_u,c_u)\\ \mathsf{exec}(c_u,c_u)\\ = \mathsf{exec}(c_u,C_u)\\ \mathsf{exec}(c_u,Q-I-1)*r+c_u)\\ \triangleq \mathsf{exec}(c_u,Q-I-1)*r+c_u)\\ \Delta;\Phi;\Omega'\vdash_0^0\mathsf{updt}\;p\;m\;0:\{\gamma_3\to\{M\}\}\;\exists_.\mathsf{int}\;\{\gamma_3\to\{M\}\}\\ \equiv \mathsf{exec}(c_u,Q-I-1)*r+c_u)\\ \Delta;\Phi;\Omega'\vdash_0^0\mathsf{updt}\;p\;m\;0:\{\gamma_3\to\{M\}\}\;\exists_.\mathsf{int}\;\{\gamma_3\to\{M\}\}\}$$

For if (1), it is similar by using U-exec and subtyping rule S-A-MONAD to make its type consistent with if (2).

Relational type

There are two cases we need to consider for relational types. We first apply some simple relational rules R-ILAM and R-ABS. Subscription 1 and 2 are used for the two runs. We apply R-CIMPL to introduce the constraints into the constraint environment Φ .

Set
$$Z$$
 as the body of the function helper. where $C = (I < Q < N \land M + I < N)$ and
$$\frac{\text{diff}((Q-1-min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r)}{\tau = \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \; \exists \text{_unit} \; \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\}. }$$

To show the type of part Z, we will use the rule R-SPLIT first.

$$\begin{split} & \Sigma; \Delta; \Phi \land C \land I \not\in \beta_2; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau \dots (Case1) \\ & \Sigma; \Delta; \Phi \land C \land I \in \beta_2; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau \dots (Case2) \\ & \Sigma; \Delta; \Phi \land C; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau \end{split}_{R-SPLIT}$$

Case 1 $I \not\in \beta_2$

Because $I \not\in \beta_2 \Rightarrow b_1 = b_2$. We know $a_1 = a_2$, $m_1 = m_2$ and $i_1 = i_2$. The two runs will go to the same path,, in the rest part of the proof, we think $\Phi' = \Phi \wedge (I < Q < N \wedge M + I < N) \wedge i \notin \beta_2$. After two reads, we will reach a if conditional.

R-READ

$$\Delta; \Phi'; \Gamma \vdash a \ominus a \lesssim 0 : \mathsf{Array}_{\gamma}[n] \ \tau$$

$$\Delta; \Phi'; \Gamma \vdash k \ominus k \lesssim 0 : \mathsf{int}[i] \qquad \Delta; \Phi' \models i \leq n \qquad \Delta; \vdash \mathsf{empty} \quad wf$$

$$\Delta; \Phi'; \Gamma \vdash \mathsf{read} \ S \ (m+i) \ominus \mathsf{read} \ S \ (m+i) \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \ \exists_\mathsf{int} \ \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\}$$

Set R as the outer if if $(i + 1 == l_w)$ then (1) else (2). Set V as let b = read W i in R.

$$\Delta; \Phi \vdash i + 1 == l_w \ominus i + 1 == l_w \lesssim 0 : \text{unit} + \text{unit} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Delta; \Phi; \Gamma \vdash (1) \ominus (1) \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists _. \text{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Delta; \Phi; \Gamma \vdash (2) \ominus (2) \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists _. \text{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Delta; \Phi; \Gamma \vdash R \ominus R \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists _. \text{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}(0) \\ \Delta; \Phi; \Gamma \vdash \text{read } W \ i \ominus \text{read } W \ i \lesssim 0 : \{\gamma_2 \to \beta_2\} \exists _: \text{int} \{\gamma_2 \to \beta_2\} \quad P_2 = \text{empty} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Delta; \Phi; \Gamma \vdash \text{read } S \ (m+i) \ominus \text{read } S \ (m+i) \lesssim 0 : \{\gamma_1 \to \emptyset, \beta_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}(0) \\ \Delta; \Phi; \Gamma \vdash \text{read } S \ (m+i) \ominus \text{read } S \ (m+i) \lesssim 0 : \{\gamma_1 \to \emptyset, \beta_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Delta; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists _. \text{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Lambda; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists _. \text{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Lambda; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists _. \text{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}((Q-1-\min(MIN(\beta_2 \cap [I,\infty)),Q-1))*r) \\ \Lambda; \Phi; \Gamma \vdash Z \ominus Z \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \exists _. \text{unit} \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \}$$

(a) The relative cost for (1) is 0, because the cost of update is the same. We use sub-typing rule **S-RM** to make the types of two branches consistent.

(b) The relative cost of (2) depends on its first branch , which is a recursive call of the f function. We know that the relative cost is $(Q-1-min(MIN(\beta_2\cap [I,\infty)),Q-1))*r$ by using relational typing rules R-APP and R-Iapp . Because we already know $i\not\in\beta$, it is easy to infer that $MIN(\beta_2\cap [I,\infty))=MIN(\beta_2\cap [I+1,\infty))$.

Case 2 $I \in \beta_2$.

When $i \in \beta_2$, b_1 may not be the same as b_2 , which means the two runs may go to different branches when reaching the if conditional. So we will switch to unary typing. From **R-S**, we know

 $\begin{array}{c} \operatorname{diff}((Q-1-min(MIN(\beta_{2}\cap [I,\infty)),Q-1))*r) \\ \text{the relative cost of helper is } (Q-I-1)*r, \text{ the type is still } \{\gamma_{1} \rightarrow \emptyset,\gamma_{2} \rightarrow \beta_{2},\gamma_{3} \rightarrow \beta_{3}\} \ \exists_. \text{unit } \{\gamma_{1} \rightarrow \emptyset,\gamma_{2} \rightarrow \beta_{2},\gamma_{3} \rightarrow \beta_{3} \cup \{I,\infty\}, \{I,\infty\},$

We get the unary type of function helper from the context $|\Gamma|$ and apply U-IAPP and U-APP to get the unary type of the body:

$$\{\gamma_3 \rightarrow \{M\}\} \exists _. \text{unit } \{\gamma_3 \rightarrow \{M\}\}\}$$

By applying unary subtyping rule **S-UM**, we know the following unary typing used in **R-S**.

$$\Delta; \Phi; |\Gamma|_1 \vdash_0^0 (1) : \{\gamma_3 \to \{M\}\} \exists _. \text{unit } \{\gamma_3 \to \{M\}\} \\ \Delta; \Phi; |\Gamma|_2 \vdash_0^0 (1) : \{\gamma_3 \to \{M\}\} \exists _. \text{unit } \{\gamma_3 \to \{M\}\} \\ \exp(c(c_u, (Q-I-1)*r + c_u)) \\ \text{exec}(c_u, (Q-I-1)*r + c_u) \\$$

By subtyping rule **S-R-UNIT**, we get the relational type.

NSS function

$$\begin{aligned} \mathsf{NSS} &= \mathsf{fix}\,F\,(S).\,\lambda W.\lambda m.\lambda l_s.\lambda l_w.\lambda P. \\ &\quad\mathsf{if}\,\,(m+l_w) \leq l_s\,\,\mathsf{then} \\ &\quad\mathsf{let}\,\{_\} = (\mathsf{celim}\,\mathsf{search}\,S\,W\,m\,0\,l_s\,l_w\,P)\,\,\mathsf{in} \\ &\quad F(S)\,W\,(m+1)\,l_s\,l_w\,P \\ &\quad\mathsf{else} \\ &\quad\mathsf{return}\,() \end{aligned}$$

```
 \forall M. \forall \gamma_1, \gamma_2, \gamma_3 : \mathbb{L}. \forall Q, N : \mathbb{N}. (Q \leq N \land M + Q \leq N) \subset \mathsf{Array}_{\gamma_1}[N] \text{ int} \rightarrow \\ \vdash \mathsf{NSS} \ominus \mathsf{NSS} \lesssim 0 : \begin{cases} \mathsf{Array}_{\gamma_2}[Q] \text{ int} \rightarrow \text{int}[M] \rightarrow \text{int}[N] \rightarrow \text{int}[Q] \rightarrow \mathsf{Array}_{\gamma_3}[N] \text{ int} \rightarrow \\ & \text{diff}((Q - 1 - \min(MIN(\beta_2 \cap [0, \infty), Q - 1)) * r * (N - M - Q))} \\ \{\gamma_1 \rightarrow \emptyset, \gamma_2 \rightarrow \beta_2, \gamma_3 \rightarrow \beta_3\} \ \exists \text{\_unit} \ \{\gamma_1 \rightarrow \emptyset, \gamma_2 \rightarrow \beta_2, \gamma_3 \rightarrow \beta_3 \cup [M, N]\} \end{cases}
```

For the type of NSS, we first apply R-FIX. Then we apply R-ILAM and R-ABS multiple times. Then after we introduce the constraints $(Q \le N \land M + Q \le N)$ into the constraint environment Φ , the cost comes from the first branch.

```
Set K as (celim helper SW \ m0 \ l_s \ l_w \ P) , Set Q as F(S) \ W \ (m+1) \ l_s \ l_w \ P.

Set X as let \_= (celim helper SW \ m0 \ l_s \ l_w \ P) in F(S) \ W \ (m+1) \ l_s \ l_w \ P.

R-LET  \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} = \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} * \text{empty } \\ \text{diff}((Q-1-min(MIN(\beta_2\cap[0,\infty),Q-1))*r) \\ \Delta; \Phi; \Gamma \vdash K \ominus K \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \ \exists \_\text{unit } \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \\ \text{diff}((Q-1-min(MIN(\beta_2\cap[0,\infty),Q-1))*r*(N-(M+1)-Q)) \\ \Delta; \Phi; \Gamma \vdash Q \ominus Q \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\}\} \ \exists \_\text{unit } \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup \{M\} \cup [M+1,N]\} \\ \text{diff}((Q-1-min(MIN(\beta_2\cap[0,\infty),Q-1))*r*(N-M-Q)) \\ \Delta; \Phi; \Gamma \vdash X \ominus X \lesssim 0 : \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3\} \ \exists \_\text{unit } \{\gamma_1 \to \emptyset, \gamma_2 \to \beta_2, \gamma_3 \to \beta_3 \cup [M,N]\}
```

3.4 Boolean Or

```
BoolOr = fix f (_).\Lambda.\Lambda.\Lambda.\Lambda.\lambdas. \lambdam.\lambdal<sub>s</sub>.
                                                                              if m < l_s then
                                                                                     let \{a\} = read s m in
                                                                                                if a then
                                                                                                       return true
                                                                                                else
                                                                                                       (\text{celim f}()[][][]]) s(m+1) l_s
                                                                              else
                                                                                     return false
                                                                                                 unit \rightarrow \forall \gamma_1 : \mathbb{L}. \forall M, N : \mathbb{N}. (M \leq N) \supset Array_{\gamma_1}[N] \text{ bool} \rightarrow
                                                                                                 int[M] \rightarrow int[N] \rightarrow
                               BoolOr
                                                                                                 \begin{array}{c} \operatorname{exec}(3,(N-M)*3+1) \\ \{\gamma_1 \to \emptyset\} \ \exists \text{\_.bool} \ \{\gamma_1 \to \emptyset\} \end{array}
                                                                  \operatorname{unit}_r \to \forall \gamma_1 : \mathbb{L}. \forall M, N : \mathbb{N}. \forall \beta_1. (M \leq N) \supset \operatorname{Array}_{\gamma_1}[N] U(\text{bool}, \text{bool})
\vdash \mathsf{BoolOr} \ominus \mathsf{BoolOr} \lesssim 0: \quad \xrightarrow{\cdot \inf[M] \to \inf[N] \to} 
                                                                  \begin{array}{l} \operatorname{diff}((N-1-min(MIN(\beta_1\cap[M,\infty)),N))*3+1) \\ \{\gamma_1 \to \beta_1\} \ \exists ..U(\text{bool, bool}) \ \{\gamma_1 \to \beta_1\} \end{array}
```

For the relational type, we show the type derivation on case analysis using R-Split rule.

```
\text{Set } Z \text{ as the body of the function. where } C = (M \leq N) \text{ and } \tau = \{\gamma_1 \rightarrow \beta_1\} \ \exists\_.U(\text{bool}, \text{bool}) \ \{\gamma_1 \rightarrow \beta_1\}.
```

To show the type of part Z, we will use the rule R-SPLIT first.

$$\frac{\Sigma; \Delta; \Phi \land C \land M \not\in \beta_1; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau \dots (Case\ 1)}{\Sigma; \Delta; \Phi \land C \land M \in \beta_1; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau \dots (Case\ 2)}{\Sigma; \Delta; \Phi \land C; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau} \xrightarrow{\text{R-SPLIT}}$$

Case 1 $M \not\in \beta_1$

Because $M \notin \beta_1$. We know the two runs will go to the same path and we use relational typing rules to obtain the relational type of the body Z. After applying the rule R-Case, we need to show the type of the two branches respectively. Set the first branch as (1), the second (return false) as (2).

$$\Delta; \Phi \vdash a \ominus a \lesssim 0 : \text{unit} + \text{unit} \qquad \Delta; \Phi; \Gamma \vdash (1) \ominus (1) \lesssim 0 : \{\gamma_1 \rightarrow \beta_1\} \ \exists_.U(\text{bool}, \text{bool}) \ \{\gamma_1 \rightarrow \beta_1\} \ \exists_.U(\text{bool},$$

- (a) The relative cost for (2) is 0, because return false causes no relative cost. We use sub-typing rule **S-RM** to make the types of two branches consistent.
- (b) The relative cost of (1) depends on its second branch, which is a recursive call of the f function. We know that the relative cost is $(N-min(MIN(\beta_1\cap [M,\infty)),N))*r$ by using relational typing rules R-APP and R-Iapp. Because we already know $M\not\in\beta_1$, it is easy to infer that $MIN(\beta_1\cap [M,\infty))=MIN(\beta_1\cap [M+1,\infty))$.

Case 2 $M \in \beta_1$.

When $M \in \beta_1$, the two runs may go to different branches when reaching the if conditional. So we will switch to unary typing. From **R-S**, we know the relative cost of the function is (N-M-1)*3+1, $diff((N-1-min(MN(\beta_1\cap [M-\infty),N))*3+1))$

We get the unary type of function body from the context $|\Gamma|$ and apply U-IAPP and U-APP to get the unary type of the body:

$$\begin{array}{c} \operatorname{exec}(3,(N-M)*3+1) \\ \{\gamma_1 \to \emptyset\} \ \exists _. bool \ \{\gamma_1 \to \emptyset\} \end{array}$$

By applying unary subtyping rule S-UM, we know the following unary typing used in R-S.

$$\begin{split} & = \operatorname{exec}(3,(N-M)*3+1) & = \operatorname{exec}(3,(N-M)*3+1) \\ & \models U(\{\gamma_1 \to \emptyset\} \ \exists_.\operatorname{bool} \ \{\gamma_1 \to \emptyset\}, \{\gamma_1 \to \emptyset\} \ \exists_.\operatorname{bool} \ \{\gamma_1 \to \emptyset\}) \sqsubseteq \\ & \qquad \qquad \{\gamma_1 \to \beta_1\} \ \exists_.U(\operatorname{bool},\operatorname{bool}) \ \{\gamma_1 \to \beta_1\} \end{split}$$

3.5 Boolean Or, two implementations

We have two implementaions for the above Boolean or functions.

```
fix BoolOr1 (_).\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\lambdas. \lambdam.\lambda l_s.

if m < l_s then
let \{a\} = read s m in
if a then
return true
else
(celim BoolOr1()[][][][]] s (m+1) l_s
else
return f alse
```

The unary type of BoolOr1 as follows.

The following BoolOr2 is another implenmentation of BoolOr.

```
fix BoolOr2(_).\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\lambdas. \lambdam.\lambda l_s.

if m < l_s then

let \{a\} = read s m in

if (celim BoolOr2()[][][][]]) s (m+1) l_s) then

return tr ue

else

return a

else

return f alse
```

With its unary type presented below.

```
 \begin{array}{ccc} & & & & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\
```

We can obtain the relational type with relative cost 0.

```
\vdash \mathsf{BoolOr1} \ominus \mathsf{BoolOr2} \lesssim 0: \\ \underset{l}{\mathsf{unit}_r} \rightarrow \forall \gamma_1 : \mathbb{L}. \forall M, N : \mathbb{N}. \forall \beta_1. (M \leq N) \supset U(\mathsf{Array}_{\gamma_1}[N] \ \mathsf{bool}, \mathsf{Array}_{\gamma_1}[N] \ \mathsf{bool}) \\ \rightarrow U(\mathsf{int}[M], \mathsf{int}[M]) \rightarrow U(\mathsf{int}[N], \mathsf{int}[N]) \rightarrow \{\gamma_1 \rightarrow \beta_1\} \ \exists\_. U(\mathsf{bool}, \mathsf{bool}) \ \{\gamma_1 \rightarrow \beta_1\} \ \exists\_. U(\mathsf{bool}, \mathsf{bool}) \ \mathsf{bool} \}
```

The derivation mainly relies on the switch rules.

```
 \begin{array}{c} (\operatorname{exec}(3,(N-M)*3+1)) \\ \Delta;\Phi;|\Gamma|_1\vdash_0^0\operatorname{BoolOr1}:A\to \{\gamma_1\to\emptyset\}\ \exists\_.\operatorname{bool}\ \{\gamma_1\to\emptyset\}\\ (N-M)*3+1,(N-M)*3+1) \\ \Delta;\Phi;|\Gamma|_2\vdash_0^0\operatorname{BoolOr2}:A\to \{\gamma_1\to\emptyset\}\ \exists\_.\operatorname{bool}\ \{\gamma_1\to\emptyset\}\\ (N-M)*3+1) \\ (N-M)*3+1) \\ (N-M)*3+1) \\ U(A\to \{\gamma_1\to\emptyset\}\ \exists\_.\operatorname{bool}\ \{\gamma_1\to\emptyset\},A\to \{\gamma_1\to\emptyset\}\ \exists\_.\operatorname{bool}\ \{\gamma_1\to\emptyset\}) \end{array}  R-S
```

We set A to be unit $\rightarrow \forall \gamma_1 : \mathbb{L} . \forall M, N : \mathbb{N} . (M \le N) \supset Array_{\gamma_1}[N] \text{ bool} \rightarrow int[M] \rightarrow int[N] \rightarrow .$

 $\begin{array}{c} \operatorname{exec}(3,(N-M)*3+1) & \operatorname{exec}((N-M)*3+1,(N-M)*3+1) \\ \operatorname{We} \ \operatorname{set} \ A_1 \ \operatorname{to} \ \operatorname{be} \ \{\gamma_1 \to \emptyset\} \ \exists_.\operatorname{bool} \ \{\gamma_1 \to \emptyset\}. \end{array}$ $\begin{array}{c} \operatorname{exec}((N-M)*3+1,(N-M)*3+1) \\ \text{We} \ \operatorname{set} \ A_1 \ \operatorname{to} \ \operatorname{be} \ \{\gamma_1 \to \emptyset\} \ \exists_.\operatorname{bool} \ \{\gamma_1 \to \emptyset\}. \end{array}$ $\begin{array}{c} \operatorname{exec}((N-M)*3+1,(N-M)*3+1) \\ \text{We} \ \operatorname{set} \ A_2 \ \operatorname{to} \ \operatorname{be} \ \{\gamma_1 \to \emptyset\} \ \exists_.\operatorname{bool} \ \{\gamma_1 \to \emptyset\}. \end{array}$

We set τ to be $\operatorname{unit}_r \to \forall \gamma_1 : \mathbb{L}. \forall M, N : \mathbb{N}. \forall \beta_1. (M \leq N) \supset U(\operatorname{Array}_{\gamma_1}[N] \text{ bool}, \operatorname{Array}_{\gamma_1}[N] \text{ bool}) \to U(\operatorname{int}[M], \operatorname{int}[M]) \to U(\operatorname{int}[N], \operatorname{int}[N]).$

We set τ' to be $\{\gamma_1 \to \beta_1\}$ $\exists ... U(bool, bool)$ $\{\gamma_1 \to \beta_1\}$.

Use the subtyping rules S-R-FORALL-U, S-R-CIMPL-U and S-R-EXECDIFF, we can show that

$$\models U(A \rightarrow A_1, A \rightarrow A_2) \sqsubseteq \tau \rightarrow U(A_1, A_2)$$

Next, using the monadic sutyping S-RUM, we can show that

$$\begin{split} & = U(\{\gamma_1 \rightarrow \varnothing\} \ \exists_.bool \ \{\gamma_1 \rightarrow \varnothing\}, \{\gamma_1 \rightarrow \varnothing\} \ \exists_.bool \ \{\gamma_1 \rightarrow \varnothing\}, \{\gamma_1 \rightarrow \varnothing\} \ \exists_.bool \ \{\gamma_1 \rightarrow \varnothing\}) \sqsubseteq \\ & \{\gamma_1 \rightarrow \beta_1\} \ \exists_.U(bool,bool) \ \{\gamma_1 \rightarrow \beta_1\} \end{split}$$

Finally, using the ruele R-EXEC, we can derive the relational type shown above.

3.6 Insertion sort

```
fix |\operatorname{Sort}(\_).\Lambda.\Lambda.\Lambda.\Lambda.\lambda s.\lambda i.\lambda l_s. if i < l_s then  |\operatorname{let} \{a\} = \operatorname{read} s \ i \ \text{in}   |\operatorname{let} \{b\} = \operatorname{celim}(insert() \ [] \ [] \ [] \ [] \ [] \ s \ a \ 0 \ i \ \text{in}   \operatorname{celim}(|\operatorname{Sort}() \ [] \ [] \ [] \ [] \ s \ (i+1) \ l_s   \operatorname{else}   \operatorname{return}()
```

$$\text{unit} \rightarrow \forall \gamma_1 : \mathbb{L}. \forall N, I : \mathbb{N}. (I \leq N) \supset \operatorname{Array}_{\gamma_1}[N] \text{ int} \rightarrow \inf[I] \rightarrow \inf[N] \rightarrow \inf[I] \rightarrow \inf[N] \rightarrow \exp(\frac{(N+1)*(N+2)-(I+1)*(I+2)}{2}, (2N+1)*(N+1)-(2I+3)*(I+1)) } \\ \{\gamma_1 \rightarrow \mathbb{N}\} \ \exists \text{_unit} \ \{\gamma_1 \rightarrow \mathbb{N}\}$$

where minimal cost obtained when the array is already sorted in the ascending order and the maximal cost corresponds to a sorted array in the descending order.

$$\begin{aligned} & \text{unit}_r \to \forall \gamma_1 : \mathbb{L}. \forall N, I : \mathbb{N}. \forall \beta_1. (I \leq N) \supset & \text{Array}_{\gamma_1}[N] \text{ int} \\ & \mapsto & \text{int}[I] \to & \text{int}[N] \to \\ & & & \text{diff}(\frac{N*(N+1)-k*(k+1)}{2}) \\ & & \{\gamma_1 \to \beta_1\} \ \exists_. \\ & \text{unit}_r \ \{\gamma_1 \to \mathbb{N}\} \end{aligned}$$

where $k = max(I, min(MIN(\beta_1), N))$.

```
fix insert (_).\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\lambdas.\lambdaa.\lambdaidx.\lambdai. let \{b\} = read s idx in if a \ge b then celim(insert() [] [] [] [] s a (idx + 1) i else let _ = celim(shift() [] [] [] s idx (i - 1) in updt s idx a
```

```
 \begin{array}{ll} & \text{unit} \rightarrow \forall \gamma_1 : \mathbb{L}. \forall N, A, IDX, I : \mathbb{N}. (IDX \leq N \land I \leq N) \supset \text{Array}_{\gamma_1}[N] \text{ int} \rightarrow \\ & \text{int} \rightarrow \text{int}[IDX] \rightarrow \text{int}[I] \rightarrow \\ & \text{exec}(I-IDX+1,2*(I-IDX)+2) \\ & \{\gamma_1 \rightarrow \mathbb{N}\} \ \exists\_. \text{unit} \ \{\gamma_1 \rightarrow \mathbb{N}\} \end{array}
```

where the minimal cost consists of one update operation and (I-IDX) times read operations when the value 'a' inserted is already the biggest element in the sequence ranging from [idx, i]. the maximal cost consists of 2*(I-IDX) coming from shift and one read and update operation in addition when the inserted value 'a' is the smallest element in the sequence.

The relational cost of insert function is 0 when the premise $\beta_1 \cap [IDX, I] = \emptyset$ holds, which means in the range [IDX, I], the elements of arrays on the two runs are exactly the same. Considering we are inserting the same value 'a' (s[I]), it always goes into the same path and hence incurs no relative cost.

```
fix shift ().\Lambda.\Lambda.\Lambda.\Lambda.\Lambda.\lambda s.\lambda idx.\lambda i. if idx \le i then  |et \{c\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in   |et \{\}| = read \ s \ i \ in
```

where cost 2 comes from one read and one update operation.

```
\begin{aligned} & \text{unit}_r \to \forall \gamma_1 : \mathbb{L}. \forall N, IDX, I : \mathbb{N}. (IDX \leq I \land I < N) \supset & \text{Array}_{\gamma_1}[N] \text{ int} \\ \vdash & \text{shift} \ominus & \text{shift} \lesssim 0 : & \overset{\text{diff}(0)}{\to} \\ & \{\gamma_1 \to \beta_1\} \ \exists\_. \text{unit}_r \ \{\gamma_1 \to \beta_1 \cup [ID]\} \end{aligned}
```

Let us look at the derivation of the relational type of ISort.

```
\begin{aligned} &\text{fix ISort} \, ( ) . \Lambda . \Lambda . \Lambda . \Lambda . \lambda s . \lambda i . \lambda l_s. \\ &\text{if } i < l_s \text{ then} \\ &\text{let } \{a\} = \text{read } s \text{ } i \text{ in} \\ &\text{let } \{b\} = \text{celim}(insert() \, [] \, [] \, [] \, [] \, []) \text{ } s \text{ } a \text{ } 0 \text{ } i \text{ in} \\ &\text{celim}(ISort() \, [] \, [] \, [] \, []) \text{ } s(i+1) \, l_s \end{aligned} \text{else} \text{return } () \text{unit} \, \rightarrow \, \forall \gamma_1 : \mathbb{L} . \forall N, I : \mathbb{N} . (I \leq N) \supset \text{Array}_{\gamma_1} [N] \text{ int} \rightarrow \\ &\text{exec}(\frac{(N+1)*(N+2)-(I+1)*(I+2)}{2}, (2N+1)*(N+1)-(2I+3)*(I+1))} \\ &\text{int}[I] \rightarrow \text{int}[N] \rightarrow \\ &\text{int}[I] \rightarrow \text{int}[N] \rightarrow \\ &\text{value} \, \{\gamma_1 \rightarrow \mathbb{N}\} \text{ } \exists \text{ ..unit } \{\gamma_1 \rightarrow \mathbb{N}\} \end{aligned} \text{limit}_{r} \rightarrow \forall \gamma_1 : \mathbb{L} . \forall N, I : \mathbb{N} . \forall \beta_1 . (I \leq N) \supset \text{Array}_{\gamma_1} [N] \text{ int} \text{homegaphity}_{r} \rightarrow \text{int}[I] \rightarrow \text{int}[N] \rightarrow \{\gamma_1 \rightarrow \beta_1\} \text{ } \exists \text{ ..unit}_{r} \, \{\gamma_1 \rightarrow \mathbb{N}\} \end{aligned}
```

where $k = max(I, min(MIN(\beta_1), N))$.

We first apply the fix-ext rule to store the unary information of ISort into the context. After several application of R-ILam and R-Abs rules as well as the rule R-CImpl, we introduce the index variables, variables and the constraint to the left side of the typing judgment. We will focus on the relational type of the body of the function ISort.

```
Set Z as the body of the function. where C = (I \le N) and  \frac{\operatorname{diff}(\frac{N*(N+1)-k*(k+1)}{2})}{2}  \tau = \{\gamma_1 \to \beta_1\} \ \exists \_.\operatorname{unit}_r \ \{\gamma_1 \to \mathbb{N}\}.
```

To show the type of part Z, we will use the rule R-SPLIT first.

$$\frac{\Sigma; \Delta; \Phi \land C \land \beta_1 \cap [0, I] = \emptyset; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau \dots (Case 1)}{\Sigma; \Delta; \Phi \land C \land \beta_1 \cap [0, I] \neq \emptyset; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau \dots (Case 2)}{\Sigma; \Delta; \Phi \land C; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau} \xrightarrow{\text{R-SPLIT}}$$

Case 1 $\beta_1 \cap [0, I] = \emptyset$

We know the two runs will go to the same path and we use relational typing rules to obtain the relational type of the body Z. After applying the rule R-Case, we need to show the type of the two branches respectively. Set the first branch as (1), the second (return ()) as (2), Φ' to be the updated constraint environment.

$$\frac{\Delta; \Phi' \vdash i < l_s \ominus i < l_s \lesssim 0 : \text{unit} + \text{unit} \qquad \Delta; \Phi'; \Gamma \vdash (1) \ominus (1) \lesssim 0 : \tau \qquad \Delta; \Phi'; \Gamma \vdash (2) \ominus (2) \lesssim 0 : \tau}{\Delta; \Phi'; \Gamma \vdash Z \ominus Z \lesssim 0 : \tau} \xrightarrow{\text{R-CASE}}$$

(a) The relative cost for (2) is 0, return () as a unit operation causes no relative cost. We use subtyping rule **S-RM** to make the types of two branches consistent.

(b) The relative cost of (1) depends on the insert function as well as the recursive call of ISort.

Set (3) as let
$$b = \text{celim}(insert() [] [] [] [] [] s \ a \ 0 \ i$$
 in $\text{celim}(ISort() [] [] [] []) s(i+1) l_s$

$$\frac{\Delta; \Phi'; \Gamma \vdash insert \ldots \ominus insert \ldots \lesssim 0 : \{\gamma_1 \rightarrow \beta_1\} \stackrel{\text{diff}(0)}{\exists _.unit_r} \{\gamma_1 \rightarrow \beta_1\}}{\Delta; \Phi'; \Gamma \vdash ISort \ldots \ominus ISort \ldots \lesssim 0 : \tau[k/k']} \xrightarrow{\text{R-LET}}$$

where $k' = max(I+1, min(MIN(\beta_1), N))$.

Because in this case, we know that $\beta_1 \cap [0, I] = \emptyset \Rightarrow k = k'$, and the relative cost of insert is 0 and the relative cost of (3) comes from the recursive call. Because we already know k' = k, it is easy to infer that $\tau[k/k'] = \tau$.

Case 2 $\beta_1 \cap [0, I] \neq \emptyset$.

The two runs may go to different branches when inserting one element into the array. So we will switch to unary typing.

We show the unary type of (3) first:

$$\begin{array}{c} \text{exec}(I+1,2I+2) \\ \Delta; \Phi; \Omega \vdash_{c_1}^{c_1} insert \cdots : \{\gamma_1 \to \mathbb{N}\} \text{ \exists_unit } \{\gamma_1 \to \mathbb{N}\} \\ & \text{exec}(\frac{(N+1)*(N+2)-(I+2)*(I+3)}{2}, (2N+1)*(N+1)-(2I+5)*(I+2)) \\ \hline \Delta; \Phi; \Omega \vdash_{c_2}^{c_2} ISort \cdots : \qquad \{\gamma_1 \to \mathbb{N}\} \text{ \exists_unit } \{\gamma_1 \to \mathbb{N}\} \\ \hline \Delta; \Phi; \Omega \vdash_{c_1+c_2+1}^{c_1+c_2+1} (3) : \qquad \{\gamma_1 \to \mathbb{N}\} \text{ \exists_unit } \{\gamma_1 \to \mathbb{N}\} \end{array} \\ \text{U-LET}$$

From **R-S**, we know the relative cost of the function ISort is $\frac{N*(N+1)-I*(I+1)}{2}$. Because we know that $\text{diff}(\frac{N*(N+1)-k*(k+1)}{2})$

$$\beta_1 \cap [0, I] \neq \emptyset \Rightarrow k = I$$
, the type is still $\{\gamma_1 \to \beta_1\} \exists \text{_unit}_r \{\gamma_1 \to \mathbb{N}\}$.

By applying unary subtyping rule S-UM, we know the following unary typing used in R-S.

$$\Delta; \Phi; |\Gamma|_1 \vdash_{c_1 + c_2 + 1}^{c_1 + c_2 + 1} (3) : \begin{cases} \exp(\frac{(N+1)*(N+2) - (I+1)*(I+2)}{2}, (2N+1)*(N+1) - (2I+3)*(I+1)) \\ \{\gamma_1 \to \mathbb{N}\} \exists \text{_unit } \{\gamma_1 \to \mathbb{N}\} \end{cases}$$

$$= \exp(\frac{(N+1)*(N+2) - (I+1)*(I+2)}{2}, (2N+1)*(N+1) - (2I+3)*(I+1))$$

$$\Delta; \Phi; |\Gamma|_2 \vdash_{c_1 + c_2 + 1}^{c_1 + c_2 + 1} (3) : \begin{cases} \gamma_1 \to \mathbb{N}\} \exists \text{_unit } \{\gamma_1 \to \mathbb{N}\} \end{cases}$$

3.8 Square and multiply (SAM)

This examples implements the square and multiply algorithm for the positive power of the a number. It bases on the observation that $x^m = (x^2)^{\frac{m}{2}}$ if m is even and $x^m = x * (x^2)^{\frac{m}{2}}$ if m is odd.

where func is a function which depends on the value of b (1 or 0), returns the result x*1 if b=1, returns 1 otherwise. The relational type is derived by split the cases on the assumption $I \in \beta$ and on the two cases, func will generates different costs based on the assumption whether $I \in \beta$ or not.

$$\begin{array}{l} \operatorname{unit}_r \to \forall \gamma_1. \forall I, N, X, \beta. (I < N) \supset \operatorname{int}[X] \to \operatorname{Array}_{\gamma_1}[N] \ U(\operatorname{bool}, \operatorname{bool}) \to \\ + \operatorname{sam} \ominus \operatorname{sam} \lesssim 0: & \operatorname{diff}(\beta \cap [I, N]) \\ & \operatorname{int}[I] \to \operatorname{int}[N] \to \{\gamma_1 \to \beta\} \ \exists_- U(\operatorname{int}) \ \{\gamma_1 \to \beta\} \end{array}$$

function func

```
\begin{aligned} & \text{fix func } (x).\lambda r.\lambda b. \\ & \text{if } b \text{ then} \\ & \text{return } x*r*r \\ & \text{else} \\ & \text{return } r*r \end{aligned} \vdash \text{func } \ominus \text{ func } \lesssim 0: \quad U(\text{int}) \to U(\text{int}) \to \text{int}_r \overset{\text{diff}(0)}{\longrightarrow} U(\text{int}) \vdash \text{ func } \ominus \text{ func } \lesssim 0: \quad U(\text{int}) \to U(\text{int}) \to U(\text{int}) \overset{\text{diff}(1)}{\longrightarrow} U(\text{int})
```

3.9 Constant-time comparison

```
\begin{split} &\text{fix comp}\,().\lambda l_1.\lambda l_2.\lambda i.\lambda n. \\ &\text{if } i < n \text{ then} \\ &\text{let } \{a\} = \text{read } l_1 \text{ } i \text{ in} \\ &\text{let } \{b\} = \text{read } l_2 \text{ } i \text{ in} \\ &\text{return boolAnd} \big( \text{celim}(comp()[][][]]) l_1 \ l_2 \ (i+1) \ n, \text{eq}(a,b) \big) \\ &\text{else} \\ &\text{return } true \end{split}
```

where function boolAnd has the type $(U(\text{bool}) \times U(\text{bool}) \stackrel{\text{diff(0)}}{\longrightarrow} U(\text{bool})$, and eq has type $(U(\text{int}) \times U(\text{int}) \stackrel{\text{diff(0)}}{\longrightarrow} U(\text{bool})$

.

$$\vdash \mathsf{comp} \ominus \mathsf{comp} \lesssim 0: \\ \begin{aligned} & \mathsf{unit}_r \to \forall \gamma_1, \gamma_2. \forall I, N, \beta_1, \beta_2. (I \geq 0) \supset \mathsf{Array}_{\gamma_1}[N] \ U(\mathsf{int}, \mathsf{int}) \to \mathsf{Array}_{\gamma_2}[N] \ U(\mathsf{int}, \mathsf{int}) \to \\ & & \mathsf{diff}(0) \\ & & \mathsf{int}[I] \to \mathsf{int}[N] \to \{\gamma_1 \to \beta_1, \gamma_2 \to \beta_2\} \ \exists_. U(\mathsf{bool}) \ \{\gamma_1 \to \beta_1, \gamma_2 \to \beta_2\} \end{aligned}$$

When we assume the two arrays has the same length N, start comparing the two arrays from the same index i on the two runs. No relative cost is generated because the execution paths across the two runs are the same.

3.10 Loop Unswitching

In the next example, we will have a look at one technique applied in compiler optimization, known as "loop unswitching". In this example, we show our system can provide a more precise relative cost than the standard worst-case/best-case analysis when dealing with two programs that are not structurally similar.

We propose a function loop in Figure 25, which operates a simple loop over an input array A, from index m, to the end of the array specified by the length of the array n of type $\operatorname{int}[N]$. Inside the loop, there is an if conditional if $b\ldots$, whose then branch reads the value in the array at index m and then does some pure computation f h on the value h just read before going into the next iteration. For simplicity, we let the else branch do nothing, return unit.

Actually, this program can be transformed a little bit, by pulling out the if conditional from the function body, as we can see in the right part of Figure 25, we call it loopOp, which is the optimized version of loop. We suppose the original loop and the optimized loopOp operates on the same array A, has the identical pure computation f inside the loop, and shares the boolean input b in two runs. Intuitively, we think the relative cost is upper bounded by N when we count one unit cost for elimination forms because the first one checks b at each iteration while the optimized one checks only once. When people use the worst-case/best-case analysis, they obtain the following unary types at first.

$$\vdash \lambda f. \lambda b. \mathsf{loop} : \\ \begin{matrix} (A \to \mathsf{unit}) \to \mathsf{bool} \to \forall \gamma_1, N, M. \\ & \mathsf{Array}_{\gamma_1}[N] \ A \to \mathsf{int}[M] \to \mathsf{int}[N] \to \{\gamma_1 \to \emptyset\} \ \exists_.\mathsf{unit} \ \{\gamma_1 \to \emptyset\} \end{matrix} \\ \vdash \lambda f. \lambda b. \mathsf{loopOp} : \\ \begin{matrix} (A \to \mathsf{unit}) \to \mathsf{bool} \to \forall \gamma_1, N, M. \\ & \mathsf{Array}_{\gamma_1}[N] \ A \to \mathsf{int}[M] \to \mathsf{int}[N] \to \{\gamma_1 \to \emptyset\} \ \exists_.\mathsf{unit} \ \{\gamma_1 \to \emptyset\} \end{matrix}$$

In the above unary type, both precondition and postcondition have location greferring to the empty set. It is consistent with our assumption that f does some pure computation, hence indicates the arrays remain intact within the execution of either loop or loopOp, which requires no writing permission. With the help of the subtyping rule **s-rum**, we obtain the relative cost, which is 3*(N-M). When we start the loop from the beginning, which means M=0, then the relative cost is bounded by 3*N, instead of our intuition N.

On the other hand, we can do better if we use the relational analysis, in particular, the relational asynchronous rule **r-e-case** in Figure **??**. Remember, we use if t then t_1 else t_2 as the syntactic sugar for the construct case $(t, x.t_1, y.t_2)$. To be precise, we can have a simplified asynchronous rule **r-e-if** from **r-e-case**.

$$\frac{\Sigma; \Delta; \Phi; |\Gamma|_2 \vdash_{L_1}^{U_1} t' : \mathsf{bool} \qquad \Sigma; \Delta; \Phi; \Gamma \vdash t \ominus t_1' \lesssim D_2 : \tau \qquad \Sigma; \Delta; \Phi; \Gamma \vdash t \ominus t_2' \lesssim D_2 : \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash t \ominus \mathsf{if} \ t' \ \mathsf{then} \ t_1' \mathsf{else} \ t_2' \lesssim D_2 - L_1 - c_{case} : \tau} \ \mathbf{r\text{-e-if}}$$

The above asynchronous rule allows us to compare loop with respect to the inner recursive function loop' inside loopOp. When we compare the body of loop and loop', when we type the then branch of the first if conditional if m < n ..., we come across the structurally dissimilar part, the red part in loop and the green part part in loop' in Figure 25. In this turn, we use a similar asynchronous rule **r**-case-e in Figure ??. In particular, we want to avoid comparing the else branch in the red part return () with the green part, when we know the conditional b agree in two runs. To this end, we can refine our

```
fix loop (A). \lambda m. \lambda n.
                                        loopOp = if b then
   if m < n then
                                                      fix loop' (A). \lambda m. \lambda n.
      if b then
                                                          if m < n then
          let \{h\} = read Am in;
                                                             let \{h\} = read Am in;
          let_{-} = f h in
                                                             let = f h in
          loop A (m+1) n
                                                             loop' A (m+1) n
      else
                                                          else
          return ()
                                                             return ()
   else
                                                      else
      return ()
                                                          \lambda A.\lambda m.\lambda n. return ()
```

Figure 25: Loop Unswitching code

boolean type bool to carry its value as we do for the integer type, bool[B] for unary boolean type and bool $_r[B]$ for the relational one, where $B \in \{\text{true}, \text{false}\}\$ so that the erasure operation over the relational type gives $|\text{bool}_r[B]|_i = \text{bool}[B]$. Now, we can have more fine-grained asynchronous rules from the aforementioned rule **e-if**.

$$\begin{split} \frac{\Sigma; \Delta; \Phi; |\Gamma|_2 \vdash_{L_1}^{U_1} t' : \text{bool[true]} \qquad \Sigma; \Delta; \Phi; \Gamma \vdash t \ominus t_1' \lesssim D_2 : \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash t \ominus \text{if } t' \text{ then } t_1' \text{else } t_2' \lesssim D_2 - L_1 - c_{case} : \tau} \quad \textbf{r-e-if-t} \\ \frac{\Sigma; \Delta; \Phi; |\Gamma|_2 \vdash_{L_1}^{U_1} t' : \text{bool[false]} \qquad \Sigma; \Delta; \Phi; \Gamma \vdash t \ominus t_2' \lesssim D_2 : \tau}{\Sigma; \Delta; \Phi; \Gamma \vdash t \ominus \text{if } t' \text{ then } t_1' \text{else } t_2' \lesssim D_2 - L_1 - c_{case} : \tau} \quad \textbf{r-e-if-f} \end{split}$$

With all the possible extensions, we are able to provide the relational type of the two programs as follows:

$$(U(A) \to \text{unit}) \to \forall B :: \{\text{true}, \text{false}\}. \text{bool}_r[B] \\ \vdash \lambda f. \lambda b. \text{loopOp} \lesssim 0 : \xrightarrow{\text{diff}(-1)} \forall \gamma_1, N, M. \text{Array}_{\gamma_1}[N] \ U(A) \to \text{int}[M] \\ \to \text{int}[N] \to \{\gamma_1 \to \emptyset\} \xrightarrow{\text{diff}(N-M)} \{\gamma_1 \to \emptyset\}$$

Notice, the negative cost -1 in the type comes from checking b at the beginning in the optimized version. And the relative cost embedded in the monadic type reflects the difference between the red and green parts for every iteration.

4.1 Metatheory

Lemma 1 (Embedding of Binary Subtyping in ARel)

If $\Delta; \Phi \models \tau \sqsubseteq \tau'$ then $\exists t \in ArelCore$ such that $\Delta; \Phi; \vdash t \ominus t \leq 0$: $c \tau \xrightarrow{\text{diff}(0)} \tau'$.

Proof. Proof is by induction on the subtyping derivation. We denote the witness t of type $\tau \xrightarrow{\text{diff}(0)} \tau'$ as $coerce_{\tau,\tau'}$ for clarity.

$$\frac{\Sigma; \Delta; \Phi \models \tau \sqsubseteq \tau' \quad \Delta; \Phi \models D \leq D' \quad \Sigma, \vec{\gamma_1}; \Delta; \Phi \models Q \subseteq Q' \quad \Sigma; \Delta; \Phi \models P' \subseteq P \quad \vec{\gamma_1} \subseteq \vec{\gamma_2}}{\Sigma; \Delta; \Phi \models \{P\} \, \exists \vec{\gamma_1}.\tau \, \{Q\} \sqsubseteq \{P'\} \, \exists \vec{\gamma_2}.\tau' \, \{Q'\}} \, \mathbf{S-rm}$$

Case

 $\text{By IH on } (\star), \exists \texttt{coerce}_{\tau,\tau'}. \ i :: S, \Delta; \Phi; \cdot \vdash \texttt{coerce}_{\tau,\tau'} \ominus \texttt{coerce}_{\tau,\tau'} \lesssim 0 : ^c \tau \xrightarrow{\text{diff}(0)} \tau'$

We can construct the following derivation where $t = \lambda x$.let $\{y\} = (x)$ in return coerce_{τ,τ'} y using the **c**r= .c-r- bind and c-r-return rules.

$$\Delta; \Phi; \cdot \vdash t \ominus t \lesssim 0 : \begin{subarray}{c} \mathsf{diff}(D) \\ \exists \vec{\gamma}_1.\tau \ \{Q\}) \xrightarrow{\mathsf{diff}(0)} (\{P'\} \xrightarrow{\exists \vec{\gamma}_2.\tau'} \{Q'\}) \end{subarray}$$

S-RUM

$$\beta_i' = \beta_i \cup T_i \cup T_i'$$

$$exec(L_iU) \qquad exec(L_i',U') \qquad diff(U-L')$$

$$\Sigma; \Delta; \Phi \vDash U(\{\gamma_i \mapsto T_i\} \exists \gamma_1'. A_1 \{Q_1\}, \{\gamma_i \mapsto T_i'\} \exists \gamma_2'. A_2 \{Q_2\}) \sqsubseteq \{\gamma_i \mapsto \beta_i\} \exists \gamma_1', \gamma_2'. U(A_1, A_2) \{\gamma_i \mapsto \beta_i'\}$$

We can construct the following derivation where $t = \lambda x$.let $\{y\} = (\text{switch } x)$ in return y using the **c**switch, c-r- bind and c-r-return rules.

$$\begin{array}{l} \operatorname{exec}(L_{i}U') \\ \triangle; \Phi; \cdot \vdash t \ominus t \lesssim 0 : {}^{c} \left(U(\{\gamma_{i} \mapsto T_{i}\} \ \exists \gamma_{1}'.A_{1} \ \{Q_{1}\}, \{\gamma_{i} \mapsto T_{i}'\} \ \exists \gamma_{2}'.A_{2} \ \{Q_{2}\}) \right) \xrightarrow{\operatorname{diff}(0)} \left(\{\gamma_{i} \mapsto \beta_{i}\} \ \exists \gamma_{1}', \gamma_{2}.U(A_{1}, A_{2}) \ \{\gamma_{i} \mapsto \beta_{i}'\} \right) \end{array}$$

Lemma 2 (Reflexivity of Predicate Equivalence in ARel)

 $\Delta; \psi_a; \Phi_a \models P \equiv P \Rightarrow \Phi \text{ and } \Delta; \psi_a; \Phi_a \models \Phi.$

Proof. By induction on the definiton of the predicate P.

П

Lemma 3 (Reflexivity of Algorithmic Binary Type Equivalence in ARel)

 $\Delta; \psi_a; \Phi_a \models \tau \equiv \tau \Rightarrow \Phi \text{ and } \Delta; \psi_a; \Phi_a \models \Phi.$

Proof. By induction on the binary type.

Lemma 4 (Reflexivity of Predicate Subtyping in ARel)

 $\Delta; \Phi_a \models^{\mathsf{A}} P \sqsubseteq P \Rightarrow \Phi \text{ and } \Delta; \Phi_a \models \Phi.$

Proof. By induction on the definiton of the predicate P.

П

Lemma 5 (Reflexivity of Unary Algorithmic Subtyping in ARel)

 $\Delta; \Phi_a \models^{\mathsf{A}} A \sqsubseteq A \Rightarrow \Phi \text{ and } \Delta; \Phi_a \models \Phi.$

Proof. By induction on the unary type.

Lemma 6 (Transitivity of Unary Algorithmic Subtyping in ARel)

If Δ ; $\Phi_a \models^A A_1 \sqsubseteq A_2 \Rightarrow \Phi_1$ and Δ ; $\Phi_a \models^A A_2 \sqsubseteq A_3 \Rightarrow \Phi_2$ and Δ ; $\Phi_a \models \Phi_1 \land \Phi_2$, then Δ ; $\Phi_a \models^A A_1 \sqsubseteq A_3 \Rightarrow \Phi_3$ for some Φ_3 such that Δ ; $\Phi_a \models \Phi_3$.

Proof. By induction on the first subtyping derivation.

Theorem 7 (Soundness of the Algorithmic Unary Subtyping in ARel)

Assume that

- 1. $\Delta; \psi_a; \Phi_a \models^{\mathsf{A}} A' \sqsubseteq A \Rightarrow \Phi$
- 2. $FIV(\Phi_a, A, A') \subseteq \Delta, \psi_a$
- 3. Δ ; $\Phi_a[\theta_a] \models \Phi[\theta_a]$ is provable s.t $\Delta \triangleright \theta_a$: ψ_a is derivable.

Then Δ ; $\Phi_a[\theta_a] \models^{\mathsf{A}} A'[\theta_a] \sqsubseteq A[\theta_a]$.

Proof. By induction on the algorithmic unary subtyping derivation.

Theorem 8 (Completeness of the Unary Algorithmic Subtyping in ARel)

Assume that Δ ; $\Phi_a \models^A A' \sqsubseteq A$. Then $\exists \Phi$. such that Δ ; $\Phi_a \models^A A' \sqsubseteq A \Rightarrow \Phi$ and Δ ; $\Phi_a \models \Phi$.

Proof. By induction on the unary subtyping derivation.

$Theorem \ 9 \ (Soundness \ of the \ Algorithmic \ Predicate \ Equality \ in \ ARel)$

Assume that

- 1. $\Delta; \psi_a; \Phi_a \models P \equiv P' \Rightarrow \Phi$
- 2. $FIV(\Phi_a, P, P') \subseteq \Delta, \psi_a$
- 3. Δ ; $\Phi_a[\theta_a] \models \Phi[\theta_a]$ is provable s.t $\Delta \triangleright \theta_a$: ψ_a is derivable.

Then Δ ; $\Phi_a[\theta_a] \models P[\theta_a] \equiv P'[\theta_a]$.

Proof. By induction on the algorithmic predicate equivalence derivation.

Theorem 10 (Soundness of the Algorithmic Binary Type Equality in ARel)

Assume that

- 1. $\Delta; \psi_a; \Phi_a \models \tau' \equiv \tau \Rightarrow \Phi$
- 2. $FIV(\Phi_a, \tau, \tau') \subseteq \Delta, \psi_a$
- 3. Δ ; $\Phi_a[\theta_a] \models \Phi[\theta_a]$ is provable s.t $\Delta \triangleright \theta_a$: ψ_a is derivable.

Then Δ ; $\Phi_a[\theta_a] \models \tau'[\theta_a] \equiv \tau[\theta_a]$.

Proof. By induction on the algorithmic binary type equivalence derivation.

Theorem 11 (Completeness of the Algorithmic Predicate Equivalence in ARel)

Assume that Δ ; $\Phi_a \models P \equiv P'$. Then $\exists \Phi$, such that Δ ; $\Phi_a \models P \equiv P' \Rightarrow \Phi$ and Δ ; $\Phi_a \models \Phi$.

Proof. By induction on the predicate equivalence derivation.

Theorem 12 (Completeness of the Binary Algorithmic Type Equivalence in ARel)

Assume that $\Sigma; \Delta; \Phi_a \models \tau' \equiv \tau$. Then $\exists \Phi$. such that $\Delta; \Phi_a \models \tau' \equiv \tau \Rightarrow \Phi$ and $\Delta; \Phi_a \models \Phi$.

Proof. By induction on the binary subtyping derivation.

$Theorem\ 13\ (Soundness\ of\ ArelCore\ \&\ Type\ Preservation\ of\ Embedding)$

The following holds.

- 1. If $\Sigma; \Delta; \Phi; \Omega \vdash_L^U t \leadsto t^* : A$, then $\Sigma; \Delta; \Phi; \Omega \vdash_L^U t^* : C$ A and $\Sigma; \Delta; \Phi; \Omega \vdash_L^U t : A$.
- 2. If Σ ; Δ ; Φ ; $\Gamma \vdash t_1 \ominus t_2 \leadsto t_1^* \ominus t_2^* \lesssim D$: τ , then Σ ; Δ ; Φ ; $\Gamma \vdash t_1^* \ominus t_2^* \lesssim D$: σ and Σ ; Δ ; Φ ; $\Gamma \vdash t_1 \ominus t_2 \lesssim D$: τ .

Proof. Proof is by simultaneous induction on the embedding derivations. The proof follows from the embedding rules.

Proof of Theorem 13.2:

 $\mathbf{Case} \ \frac{\Sigma; \Delta; \Phi_a; |\Gamma| \vdash^{U_1}_{L_1} t_1 \leadsto t_1^* : A \ (\star) \qquad \Sigma; \Delta; \Phi_a; |\Gamma| \vdash^{U_2}_{L_2} t_2 \leadsto t_2^* : A \ (\diamond)}{\Sigma; \Delta; \Phi_a; \Gamma\vdash t_1 \ominus t_2 \leadsto \mathtt{switch} \ t_1^* \ominus \mathtt{switch} \ t_2^* \lesssim U_1 - L_2 : U A} \ \mathbf{e}\text{-switch}$

By Theorem 13.1 on (\star) , we get $\Delta; \Phi; |\Gamma| \vdash_{I_1}^{U_1} t_1^* :^{c} A_1 (\star \star)$.

By Theorem 13.1 on (\diamond) , we get $\Delta; \Phi; |\Gamma| \vdash_{L_2}^{U_2} t_2^* :^c A_2$ $(\diamond \diamond)$.

Then, we conclude as follows:

$$\frac{\Delta; \Phi_a; |\Gamma| \vdash_{L_1}^{U_1} t_1 :^c A \qquad \Delta; \Phi_a; |\Gamma| \vdash_{L_2}^{U_2} t_2 :^c A}{\Sigma; \Delta; \Phi_a; \Gamma \vdash \text{switch } t_1 \ominus \text{switch } t_2 \lesssim U_1 - L_2 :^c UA} \text{ c-switch}$$

$$\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_2 \leadsto t_1^* \ominus t_2^* \lesssim D : \tau (\star)$$

$$\mathbf{Case} \ \frac{\Delta; \Phi_a \models \tau \sqsubseteq \tau' \ (\diamond) \qquad t' = \mathtt{coerce}_{\tau,\tau'} \qquad \Delta; \Phi_a \models D \leq D' \ (\dagger)}{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_2 \leadsto t' \ t_1^* \ominus t' \ t_2^* \lesssim D' : \tau'} \ \mathbf{e\text{-r-sub}}$$

By Theorem 13.2 on (\star) , Δ ; Φ ; $\Gamma \vdash t_1^* \ominus t_2^* \lesssim D$: $\tau (\star \star)$.

By Lemma 1 using (\diamond), we know that $\Delta; \Phi; \vdash t' \ominus t' \lesssim 0 : ^c \tau \xrightarrow{\text{diff}(0)} \tau' \ (\diamond \diamond)$.

By applying **c-r-app** rule and $(\star\star)$ and (\diamondsuit) , we get $\Delta; \Phi; \Gamma \vdash t't_1^* \ominus t't_2^* \lesssim D:^c \tau'$ (\spadesuit) .

By reflexivity of binary type equivalence, we know Δ ; $\Phi_a \models \tau' \equiv \tau'$ ($\spadesuit \spadesuit$).

Then, we conclude as follows:

$$\begin{split} &\Sigma; \Delta; \Phi_a; \Gamma \vdash t \ominus t' \lesssim D :^c \tau \quad (\spadesuit) \qquad \Delta; \Phi_a \models \tau \equiv \tau' \quad (\spadesuit \spadesuit) \\ &\frac{\Delta; \Phi_a \models D \leq D' \quad (\dagger)}{\Sigma; \Delta; \Phi_a; \Gamma \vdash t \ominus t' \lesssim D' :^c \tau'} \quad \mathbf{c}\text{-}\mathbf{r}\text{-}\equiv \mathbf{c} \cdot \mathbf{r} \cdot \mathbf{r}$$

$$\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \mathbf{int}[I] \quad (\star)$$

$$\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \leadsto t_2^* \ominus t_2'^* \lesssim D_2 : \tau \quad (\diamond) \qquad \gamma \text{ fresh} \qquad \Sigma; \Delta \vdash P \quad wf$$

 $\begin{array}{c} -\frac{1}{\operatorname{diff}(D_1+D_2)} \\ \Sigma; \Delta; \Phi_a; \Gamma \vdash \operatorname{alloc} t_1 \ t_2 \ominus \operatorname{alloc} t_1' \ t_2' \leadsto \operatorname{alloc} t_1^* \ t_2^* \ominus \operatorname{alloc} t_1'^* \ t_2'^* \lesssim 0 : \{P\} \ \exists \gamma. \ \operatorname{Array}_{\gamma}[I] \ \tau \ \{P \star \gamma \to \mathbb{N}\} \end{array}$ By Theorem 13.2 on (\star) , $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 :^c \operatorname{int}[I] \ (\star \star)$.

By Theorem 13.2 on (\diamond), we know that Σ ; Δ ; Φ_a ; $\Gamma \vdash t_2 \ominus t_2' \lesssim D_2$: $^c \tau$ ($\diamond \diamond$).

By applying **c-r-alloc** rule and $(\star\star)$ and $(\diamond\diamond)$, we get:

$$\frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : {}^c \operatorname{int}[I] \quad \Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : {}^c \tau \quad \gamma \text{ fresh} \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi_a; \Gamma \vdash \operatorname{alloc} t_1 \ t_2 \ominus \operatorname{alloc} t_1' \ t_2' \lesssim 0 : {}^c \left\{P\right\} \ \exists \gamma. \ \operatorname{Array}_{\gamma}[I] \ \tau \ \left\{P \star \gamma \to \mathbb{N}\right\}} \ \mathbf{c-r-alloc}$$

$$\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \ (\star)$$

 $\mathbf{Case} \frac{\boldsymbol{\Sigma}; \boldsymbol{\Delta}; \boldsymbol{\Phi}_a; \boldsymbol{\Gamma} \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus {t_1'}^* \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \ (\star)}{\boldsymbol{\Sigma}; \boldsymbol{\Delta}; \boldsymbol{\Phi}_a; \boldsymbol{\Gamma} \vdash t_2 \ominus {t_2'} \leadsto {t_2}^* \ominus {t_2'}^* \lesssim D_2 : \mathbf{int}[I'] \ (\diamond) \qquad \boldsymbol{\Delta}; \boldsymbol{\Phi}_a \models I' \leq I \qquad I' \not\in \boldsymbol{\beta} \qquad \boldsymbol{\Sigma}; \boldsymbol{\Delta} \vdash P \quad \boldsymbol{wf} \\ \boldsymbol{\Sigma}; \boldsymbol{\Delta}; \boldsymbol{\Phi}_a; \boldsymbol{\Gamma} \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1' \ t_2' \leadsto \mathsf{read} \ t_1^* \ t_2^* \ominus \mathsf{read} \ t_1'^* \ t_2'^* \lesssim 0 : \{P \star \gamma \mapsto \boldsymbol{\beta}\} \ \exists \gamma. \Box \tau \ \{P \star \gamma \mapsto \boldsymbol{\beta}\} \ diff(D_1 + D_2) \\ \boldsymbol{\Sigma}; \boldsymbol{\Delta}; \boldsymbol{\Phi}_a; \boldsymbol{\Gamma} \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1' \ t_2' \leadsto \mathsf{read} \ t_1' \ t_2' \Leftrightarrow \mathsf{read} \ t_1$

By Theorem 13.2 on (\star) , $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 :^c \mathsf{Array}_{\tau}[I] \tau \ (\star \star)$.

By Theorem 13.2 on (\diamond) , we know that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : {}^c \operatorname{int}[I'] (\diamond \diamond)$.

By applying **c-r-readb** rule and $(\star\star)$ and $(\diamond\diamond)$, we get:

$$\begin{split} & \Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : {}^c \operatorname{Array}_{\gamma}[I] \ \tau \ (\star \star) \\ & \frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : {}^c \inf[I'] \ (\diamond \diamond) \qquad \Delta; \Phi_a \vDash I' \leq I \qquad I' \not \in \beta \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi_a; \Gamma \vdash \operatorname{read}_{\square} \ t_1 \ t_2 \ominus \operatorname{read}_{\square} \ t_1' \ t_2' \lesssim 0 : {}^c \{P \star \gamma \mapsto \beta\} \ \exists ... \Box \tau \ \{P \star \gamma \mapsto \beta\} \end{split} \quad \mathbf{c\text{-r-readb}}$$

$$\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \ (\star)$$

$$\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \leadsto t_2^* \ominus t_2'^* \lesssim D_2 : \mathbf{int}[I'] \ (\bullet)$$

$$\Sigma; \Delta; \Phi_a; \Gamma \vdash t_3 \ominus t_3' \leadsto t_3^* \ominus t_3'^* \lesssim D_3 : \Box \tau \ (\dagger) \qquad \Delta; \Phi_a \models I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf$$

Case -

 $\frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_3 \ominus t_3' \leadsto t_3^* \ominus {t_3'}^* \lesssim D_3 : \Box \tau \ (\dagger) \qquad \Delta; \Phi_a \models I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi_a; \Gamma \vdash \mathsf{updt} \ t_1 \ t_2 \ t_3 \ominus \mathsf{updt} \ t_1'' \ t_2'' \ t_3'' \Rightarrow \mathsf{update}_\Box \ t_1^* \ t_2^* \ t_3'' \ominus \mathsf{update}_\Box \ t_1'' \ t_2'' \ t_3'' \lesssim 0 : \{P \star \gamma \mapsto \beta\} \ \exists \gamma. \tau \ \{P \star \beta \setminus \{I'\}\}\}} \ \mathbf{e} \cdot \mathbf{r} \cdot \mathbf{$

By Theorem 13.2 on (\star) , $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 :^c \operatorname{Array}_{\tau}[I] \tau \ (\star \star)$.

By Theorem 13.2 on (\diamond) , we know that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : {}^c \operatorname{int}[I'] (\diamond \diamond)$.

By Theorem 13.2 on (†), we know that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_3 \ominus t_3' \lesssim D_3 : {}^c \Box \tau$ (††).

By applying **c-r-updateb** rule and $(\star\star)$, $(\diamond\diamond)$ and (\dagger,\dagger) , we get:

$$\begin{split} &\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : {}^c \operatorname{Array}_{\gamma}[I] \ \tau \ (\star \star) \qquad \Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : {}^c \operatorname{int}[I'] \ (\bullet \bullet) \\ &\frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_3 \ominus t_3' \lesssim D_3 : {}^c \ \Box \tau \ (\dagger \dagger) \qquad \Delta; \Phi_a \models I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf \\ &\frac{\operatorname{diff}(D_1 + D_2 + D_3)}{\sum; \Delta; \Phi_a; \Gamma \vdash \operatorname{update}_{\square} t_1 \ t_2 \ t_3 \ominus \operatorname{update}_{\square} t_1' \ t_2' \ t_3' \lesssim 0 : {}^c \left\{ P \star \gamma \mapsto \beta \right\} \ \exists _. \operatorname{unit}_r \left\{ P \star \gamma \mapsto \beta \setminus \{I'\} \right\} \end{split}$$
 c-r-updateb

Theorem 14 (Completeness of ArelCore)

The following holds.

- 1. If $\Sigma; \Delta; \Phi; \Omega \vdash_L^U t : A$ then, $\exists \ t^*$ such that $\Sigma; \Delta; \Phi; \Omega \vdash_L^U t \leadsto t^* : A$.
- 2. If $\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim D : \tau$ then, $\exists t_1^*$ and $\exists t_2^*$ such that $\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \leadsto t_1^* \ominus t_2^* \lesssim D : \tau$.

Proof. Proof is by simultaneous induction on the typing derivations.

Proof of Theorem 14.1:

$$\mathbf{Case} \ \frac{\Sigma; \Delta; \Phi; \Omega \vdash_L^U t : A \ (\star) \qquad \Sigma; \Delta; \Phi \models A \sqsubseteq A' \qquad \Sigma; \Delta \models U \leq U' \qquad \Sigma; \Delta \models L' \leq L}{\Sigma; \Delta; \Phi; \Omega \vdash_{L'}^{U'} t : A'} \ \mathbf{u-x}$$

By Theorem 14.1 on (\star) , we get $\exists t^*$ such that $\Sigma; \Delta; \Phi_a; \Omega \vdash_L^U t \leadsto t^* : A \ (\star \star)$. By **e-u-sub** rule using $(\star \star)$, we conclude as follows.

$$\frac{\Sigma; \Delta; \Phi_a; \Omega \vdash_L^U t \leadsto t^* : A \ (\star \star) \qquad \Delta; \Phi_a \models A \sqsubseteq A' \qquad \Delta; \Phi_a \models L' \leq L \qquad \Delta; \Phi_a \models U \leq U'}{\Delta; \Phi_a; \Omega \vdash_{k'}^{t'} e \leadsto e^* : A'} \mathbf{e}\text{-}\mathbf{u}\text{-}\mathbf{sub}$$

Proof of Theorem 14.2:

$$\textbf{Case} \ \frac{\Sigma; \Delta; \Phi; |\Gamma|_1 \vdash_{L_1}^{U_1} t_1 : A_1 \ (\star) \qquad \Sigma; \Delta; \Phi; |\Gamma|_2 \vdash_{L_2}^{U_2} t_2 : A_2 \ (\textcolor{red}{\diamond})}{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_2 \lesssim U_1 - L_2 : U(A_1, A_2)} \ \textbf{r-s}$$

By Theorem 14.1 on (\star) , we get $\exists t_1^*$ such that $\Sigma; \Delta; \Phi_a; |\Gamma| \vdash_{L_1}^{U_1} t_1 \leadsto t_1^* : A_1 \quad (\star \star)$. By Theorem 14.1 on (\diamond) , we get $\exists t_2^*$ such that $\Sigma; \Delta; \Phi_a; |\Gamma| \vdash_{L_2}^{U_2} t_2 \leadsto t_2^* : A_2 \quad (\star \star)$. By **e-switch** rule using $(\star \star)$ and $(\diamond \diamond)$, we conclude as follows.

$$\frac{\Sigma; \Delta; \Phi_a; |\Gamma| \vdash_{L_1}^{U_1} t_1 \leadsto t_1^* : A_1 \ (\star \star) \qquad \Sigma; \Delta; \Phi_a; |\Gamma| \vdash_{L_2}^{U_2} t_2 \leadsto t_2^* : A_2 \ (\textcolor{red}{\otimes})}{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_2 \leadsto \text{switch } t_1^* \ominus \text{switch } t_2^* \lesssim U_1 - L_2 : U(A_1, A_2)} \ \textbf{e-switch}$$

$$\textbf{Case} \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \textbf{int}[I] \ (\star) \qquad \Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \Box \tau \ (\diamond) \qquad \gamma \ \text{fresh} \qquad \Sigma; \Delta \vdash P \quad wf}{\text{constant} \quad \text{constant} \quad \text{con$$

By Theorem 14.2 on (\star) , we get $\exists t_1^*$ such that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \operatorname{int}[I] \quad (\star \star)$. By Theorem 14.2 on (\diamond) , we get $\exists t_2^*$ such that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \leadsto t_2^* \ominus t_2'^* \lesssim D_2 : \Box \tau \quad (\diamond \diamond)$. By **e-r-allocb** rule using $(\star \star)$ and $(\diamond \diamond)$, we conclude as follows.

$$\begin{split} & \Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \mathrm{int}[I] \ (\star \star) \\ & \frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \leadsto t_2^* \ominus t_2'^* \lesssim D_2 : \Box \tau \ (\bullet \bullet) \qquad \gamma \ \mathrm{fresh} \qquad \Sigma; \Delta \vdash P \quad wf}{\mathrm{diff}(D_1 + D_2)} \mathbf{e}\text{-}\mathbf{r}\text{-}\mathbf{allocb} \\ \Sigma; \Delta; \Phi_a; \Gamma \vdash \mathrm{alloc} \ t_1' \ t_2' \ominus \mathrm{alloc}_\Box \ t_1'^* \ t_2'^* \lesssim 0 : \{P\} \ \exists \gamma. \ \mathsf{Array}_\gamma[I] \ \tau \ \{P \star \gamma \to \emptyset\} \end{split}$$

$$\mathbf{Case} \begin{tabular}{l} & \Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \\ & \mathbf{Case} \end{tabular} \\ & \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_2 \ominus t_2' \lesssim D_2 : \mathbf{int}[I'] \qquad \Delta; \Phi \models I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1' \ t_2' \lesssim 0 : \{P \star \gamma \to \beta\} \ \exists_.\tau \ \{P \star \gamma \to \beta\}} \ \mathbf{r\text{-}r} \\ & \mathbf{T} \\ & \mathbf{T}$$

By Theorem 14.2 on (\star) , we get $\exists t_1^*$ such that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \operatorname{Array}_{\gamma}[I] \tau \quad (\star \star)$. By Theorem 14.2 on (\diamond) , we get $\exists t_2^*$ such that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \leadsto t_2^* \ominus t_2'^* \lesssim D_2 : \operatorname{int}[I'] \quad (\diamond \diamond)$. By **e-r-read** rule using $(\star \star)$ and $(\diamond \diamond)$,we conclude as follows.

$$\begin{split} & \Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \mathsf{Array}_{\gamma}[I] \ \tau \ (\star \star) \\ & \frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \leadsto t_2^* \ominus t_2'^* \lesssim D_2 : \mathsf{int}[I'] \ (\bullet \bullet) \qquad \Delta; \Phi_a \models I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf}{\Sigma; \Delta; \Phi_a; \Gamma \vdash \mathsf{read} \ t_1 \ t_2 \ominus \mathsf{read} \ t_1'^* \ t_2'^* \ominus \mathsf{read} \ t_1'^* \ t_2'^* \lesssim 0 : \{P\} \ \exists \gamma. \tau \ \{P\} \end{split} \ \mathbf{e\text{-}\mathbf{read}} \ \mathbf{e\text{-}\mathbf{read}} \end{split}$$

$$\mathbf{Case} \frac{\Sigma; \Delta; \Phi; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : \{P\} \, \exists \vec{\gamma}_1.\tau \, \{P'\} \, \left(\star\right) \qquad \Sigma; \Delta, \vec{\gamma}_1 : \vec{\mathbb{L}}; \Phi; \Gamma, x : \tau \vdash t_2 \ominus t_2' \lesssim D_2 : \{P'\} \, \exists \vec{\gamma}_2.\sigma \, \{Q\} \, \left(\bullet\right)}{\Sigma; \Delta; \Phi; \Gamma \vdash \mathsf{let} \, \{x\} = t_1 \, \mathsf{in} \, t_2 \ominus \mathsf{let} \, \{x\} = t_1' \, \mathsf{in} \, t_2' \lesssim 0 : \{P\} \, \exists \vec{\gamma}_1.\vec{\gamma}_2 : \sigma \, \{Q\}} \mathbf{r\text{-bind}}$$

By Theorem 14.2 on (\star) , we get $\exists t_1^*$ such that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \leadsto t_1^* \ominus t_1'^* \lesssim D_1 : \{P_1\} \exists \vec{\gamma}_1 . \tau \{Q_1 \star Q_2\} D_1 (\star \star).$

By Theorem 14.2 on (\diamond) , we get $\exists t_2^*$ such that $\Sigma; \Delta, \vec{\gamma_1} : \vec{\mathbb{L}}; \Phi_a; \Gamma, x : \tau \vdash t_2 \ominus t_2' \leadsto t_2^* \ominus t_2^{\prime *} \lesssim D_2 : \{Q_1 \star P_2\} \exists \vec{\gamma_2}. \tau' \{Q\} \ (\diamondsuit)$. By **e-r-bind** rule using $(\star \star)$ and $(\diamond \diamond)$,we conclude as follows.

$$\Sigma; \Delta; \Phi_{a}; \Gamma \vdash t_{1} \ominus t'_{1} \leadsto t_{1}^{*} \ominus t'_{1}^{*} \lesssim D_{1} : \{P\} \stackrel{\text{diff}(D)}{\exists \vec{\gamma}_{1}.\tau} \{P'\} D_{1} (\star \star)$$

$$\Sigma; \Delta, \vec{\gamma}_{1} : \vec{\mathbb{L}}; \Phi_{a}; \Gamma, x : \tau \vdash t_{2} \ominus t'_{2} \leadsto t_{2}^{*} \ominus t'_{2}^{*} \lesssim D_{2} : \{P'\} \stackrel{\text{diff}(D')}{\exists \vec{\gamma}_{2}.\tau'} \{Q\} (\diamond \diamond)$$

e-r-bind

Theorem 15 (Invariant of the Algorithmic Typechecking)

We have the following.

- 1. Assume that $\Sigma; \Delta; \psi_a; \Phi_a; \Omega \vdash t \downarrow A, L, U \Rightarrow \Phi$ and $FIV(\Phi_a, \Omega; A, L, U) \subseteq dom(\Delta, \psi_a)$. Then $FIV(\Phi) \subseteq dom(\Delta; \psi_a)$.
- 2. Assume that $\Sigma; \Delta; \psi_a; \Phi_a; \Omega \vdash t \uparrow A \Rightarrow [\psi], L, U, \Phi$ and $FIV(\Phi_a, \Omega) \subseteq dom(\Delta, \psi_a)$. Then $FIV(A, L, U, \Phi) \subseteq dom(\Delta, \psi; \psi_a)$.
- 3. Assume that $\Sigma; \Delta; \psi_a; \Phi_a; \Gamma \vdash t \ominus t' \downarrow \tau, D \Rightarrow \Phi$ and $FIV(\Phi_a, \Gamma, \tau, D) \subseteq dom(\Delta, \psi_a)$. Then $FIV(\Phi) \subseteq dom(\Delta; \psi_a)$.
- 4. Assume that $\Sigma; \Delta; \psi_a; \Phi_a; \Gamma \vdash t \ominus t' \uparrow \tau \Rightarrow [\psi], D, \Phi$ and $FIV(\Phi_a, \Gamma) \subseteq dom(\Delta, \psi_a)$. Then $FIV(\tau, D, \Phi) \subseteq dom(\Delta; \psi; \psi_a)$.

Theorem 16 (Soundness of the Algorithmic Typechecking in ARel)

We have the following.

- 1. Assume that $\Sigma; \Delta; \psi_a; \Phi_a; \Omega \vdash t \downarrow A, L, U \Rightarrow \Phi$ and
 - 1.1. $FIV(\Phi_a, \Omega, A, L, U) \subseteq dom(\Delta, \psi_a)$
 - 1.2. $\Sigma; \Delta; \Phi_a[\theta_a] \models \Phi[\theta_a]$ is provable for some θ_a such that $\Delta \rhd \theta_a : \psi_a$ is derivable

Then
$$\Sigma; \Delta; \Phi_a[\theta_a]; \Omega[\theta_a] \vdash_{L[\theta_a]}^{U[\theta_a]} |t| :^c A[\theta_a].$$

- 2. Assume that $\Sigma; \Delta; \psi_a; \Phi_a; \Omega \vdash t \uparrow A \Rightarrow [\psi], L, U, \Phi$ and
 - 2.1. $FIV(\Phi_a, \Omega) \subseteq dom(\Delta, \psi_a)$
 - 2.2. $\forall \theta \ \forall \theta_a. \ \Delta; \Phi_a[\theta_a] \models \Phi[\theta \theta_a]$ is provable s.t $\Delta \rhd \theta : \psi$ and $\Delta \rhd \theta_a : \psi_a$ are derivable

Then
$$\Sigma; \Delta; \Phi_a[\theta_a]; \Omega[\theta_a] \vdash^{U[\theta\theta_a]}_{L[\theta\theta_a]} |t| :^c A[\theta\theta_a]$$
.

- 3. Assume that $\Delta; \psi_a; \Phi_a; \Gamma \vdash t \ominus t' \downarrow \tau, D \Rightarrow \Phi$ and
 - 3.1. $FIV(\Phi_a, \Gamma, \tau, D) \subseteq dom(\Delta, \psi_a)$
 - 3.2. Δ ; $\Phi_a[\theta_a] \models \Phi[\theta_a]$ is provable for some θ_a such that $\Delta \triangleright \theta_a$: ψ_a is derivable

Then
$$\Sigma$$
; Δ ; $\Phi_a[\theta_a]$; $\Gamma[\theta_a] \vdash |t| \ominus |t'| \lesssim D[\theta_a] : {}^c \tau[\theta_a]$.

- 4. Assume that $\Delta; \psi_a; \Phi_a; \Gamma \vdash t \ominus t' \uparrow \tau \Rightarrow [\psi], D, \Phi$ and
 - 4.1. $FIV(\Phi_a, \Gamma) \subseteq dom(\Delta, \psi_a)$
 - 4.2. $\forall \theta \ \forall \theta_a. \ \Delta; \Phi_a[\theta_a] \models \Phi[\theta \theta_a]$ is provable s.t $\Delta \rhd \theta : \psi$ and $\Delta \rhd \theta_a : \psi_a$ are derivable

Then Δ ; $\Phi_a[\theta_a]$; $\Gamma[\theta_a] \vdash |t| \ominus |t'| \lesssim D[\theta \theta_a]$: $\tau[\theta \theta_a]$.

Proof. Statements (1—4) follow from simultaneous structural induction on the algorithmic typing derivations. We present several cases below.

Proof of Theorem 16.1:

$$\begin{aligned} &\operatorname{Case} \frac{\Delta; \psi_a; \Phi_a; \Omega \vdash t \mid A, L, U \Rightarrow \Phi(s) & \Sigma; \Delta \vdash P & wf \\ A; \psi_a; \Phi_a; \Omega \vdash \text{return } t \mid [P] \stackrel{\otimes}{=} \mathbb{Z}; A[P], 0, 0 \Rightarrow \Phi \\ &\operatorname{TS:} \Sigma; \Delta; \Phi_a[\theta_a]; \Omega[\theta_a] \vdash U^{[\theta_a]}_{L[\theta_a]} \mid \text{return } t \mid \mathcal{E}^{\operatorname{exec}(L,D)}_{L[\theta_a]} \mid \mathcal{E}^{\operatorname{gl}}_{[\theta_a]} = \mathcal{E}^{\operatorname{gl}}_{[\theta_a]} \mathcal{E}^{\operatorname{gl}}_{[\theta$$

Proof of Theorem 16.3:

$$\Sigma; \Delta; \psi_a; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \uparrow \mathsf{Array}_{\gamma}[I] \tau \Rightarrow [\psi_1], D_1, \Phi_1(a) \qquad \Sigma; \Delta; \psi_a, \psi_1; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \uparrow \mathsf{int}[I'] \Rightarrow [\psi_2], D_2, \Phi_2(b)$$

$$\Sigma; \Delta; \psi_a; \Phi_a \vDash I' \leq I \land \beta' = \beta / \{I'\}$$

$$D_3 \in \mathsf{fresh}(\mathbb{R}) \qquad \Sigma; \Delta; D_3, \psi_2, \psi_1, \psi_a; \Phi_a; \Gamma \vdash t_3 \ominus t_3' \downarrow \Box \tau, D_3 \Rightarrow \Phi_3(c)$$

$$P = P' \star \gamma \rightarrow \beta \qquad Q = P' \star \gamma \rightarrow \beta' \qquad \Phi = \Phi_2 \land D_1 + D_2 + D_3 \doteq D \qquad \Sigma; \Delta \vdash P' \quad wf$$

$$\Sigma; \Delta; \psi_a; \Phi_a; \Gamma \vdash \mathsf{update}_{\Box} t_1 \ t_2 \ t_3 \ominus \mathsf{update}_{\Box} t_1' \ t_2' \ t_3' \downarrow \{P\} \ \exists_-\mathsf{unit} \ \{Q\}, 0 \Rightarrow \exists (\psi_1). (\Phi_1 \land (\exists (\psi_2). (\Phi_2 \land \exists D_3 :: \mathbb{R}.\Phi)))$$

$$\mathsf{TS}: \Sigma; \Delta; \Phi_a[\theta_a]; \Gamma[\theta_a] \vdash | \mathsf{update}_{\Box} t_1 \ t_2 \ t_3 | \ominus \mathsf{update}_{\Box} t_1' \ t_2' \ t_3' | \lesssim D[\theta_a] :^c \{P\} \ \exists_-\mathsf{unit} \ \{Q\}[\theta_a].$$
By the main assumptions, we have $\mathsf{FIV}(\Phi_a, \Gamma, (\{P\} \ \exists_-\mathsf{unit} \ \{Q\}, D) \subseteq dom(\Delta, \psi_a) \ (\star)$

$$\Delta; \Phi_a[\theta_a] \models (\exists (\psi_1). (\Phi_1 \land (\exists (\psi_2). (\Phi_2 \land \exists D_3 :: \mathbb{R}.\Phi))))[\theta_a] \ (\star \star)$$
By Theorem 15 on (\star) and the first premise, then we get $\mathsf{FIV}(\mathsf{Array}_{\gamma}[I] \ \tau, D_1, \Phi_1) \subseteq dom(\Delta, \psi_a, \psi_1) \ (1).$
Similarly on the second premise, we have $\mathsf{FIV}(\mathsf{int}[I'], D_2, \Phi_2) \subseteq dom(\Delta, \psi_a, \psi_1, \psi_2) \ (2)$

Using (\star) , (1), (2), $(\star\star)$'s derivation must be in a form such that we have

- a) $\Delta \vdash d_3 :: \mathbb{R}$
- b) Δ ; $\Phi_a[\theta_a] \models \Phi_1[\theta_a]$
- c) Δ ; $\Phi_a[\theta_a] \models \Phi_2[\theta_a]$
- d) Δ ; $\Phi_a[\theta_a] \models \Phi_3[\theta_a, D_3 \mapsto d_3]$
- e) Δ ; $\Phi_a[\theta_a] \models (D_1[\theta_a] + D_2[\theta_a] + d_3) \doteq D[\theta_a]$

By Theorem 16.4 on (a) using (1) and (a), we know:

$$\Sigma; \Delta; \Phi_a[\theta_a]; \Gamma[\theta_a] \vdash |t_1| \ominus |t_1'| \lesssim D_1[\theta \theta_a] : ^c Array_{\gamma}[I] \tau[\theta \theta_a] (\star)$$

By Theorem 16.4 on (b) using (2) and c), we know:

$$\Sigma; \Delta; \Phi_a[\theta_a]; \Gamma[\theta_a] \vdash |t_2| \ominus |t_2'| \lesssim D_2[\theta \theta_a] : c \text{ int}[I'][\theta \theta_a] \diamond$$

By Theorem 16.3 on (c) using (1)(2) and d), we know:

$$\Sigma; \Delta; \Phi_a[\theta_a]; \Gamma[\theta_a] \vdash |t_3| \ominus |t_3'| \lesssim d_3 : {}^c \Box \tau[\theta_a]$$
 (†)

Using the above statements and the premises, we can conclude using the rule **c-r-updateb**.

$$\begin{split} \Sigma; \Delta; \Phi_{a}[\theta_{a}]; \Gamma[\theta_{a}] \vdash |t_{1}| \ominus |t_{1}'| \lesssim D_{1}[\theta\theta_{a}] : ^{c} \operatorname{Array}_{\gamma}[I] \ \tau[\theta\theta_{a}] \ (\star) \\ \Sigma; \Delta; \Phi_{a}[\theta_{a}]; \Gamma[\theta_{a}] \vdash |t_{2}| \ominus |t_{2}'| \lesssim D_{2}[\theta\theta_{a}] : ^{c} \operatorname{int}[I'][\theta\theta_{a}] \ (\diamond) \\ \\ \frac{\Sigma; \Delta; \Phi_{a}[\theta_{a}]; \Gamma[\theta_{a}] \vdash |t_{3}| \ominus |t_{3}'| \lesssim d_{3} : ^{c} \Box \tau[\theta_{a}] \ (\dagger) \qquad \Delta; \Phi_{a} \vDash I' \leq I \qquad \Sigma; \Delta \vdash P \quad wf}{\operatorname{diff}(D[\theta_{a}])} \\ \Sigma; \Delta; \Phi_{a}[\theta_{a}]; \Gamma[\theta_{a}] \vdash |\operatorname{update}_{\Box} \ t_{1} \ t_{2} \ t_{3} \ |\ominus| \operatorname{update}_{\Box} \ t_{1}' \ t_{2}' \ t_{3}' \ |\lesssim 0 : ^{c} \{P \star \gamma \mapsto \beta\} \ \exists_. \operatorname{unit}_{r} \{P \star \gamma \mapsto \beta \setminus \{I'\}\} \end{split}$$

Theorem 17 (Completeness of the Algorithmic Typechecking in Arel)

We have the following.

1. Assume that $\Sigma; \Delta; \Phi_a; \Omega \vdash_I^U t :^c A$. Then, $\exists t'$ such that

1.1.
$$\Sigma; \Delta; \cdot; \Phi_a; \Omega \vdash t' \downarrow A, L, U \Rightarrow \Phi$$

- 1.2. Δ ; $\Phi_a \models \Phi$
- 1.3. |t'| = t

101

2. Assume that $\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_2 \lesssim D : {}^c \tau$. Then, $\exists t_1', t_2'$ such that

2.1.
$$\Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash t_1' \ominus t_2' \downarrow \tau, D \Rightarrow \Phi$$

2.2.
$$\Delta$$
; $\Phi_a \models \Phi$

2.3.
$$|t_1'| = t_1$$
 and $|t_2'| = t_2$

Proof. Proof is by simultaneous induction on the ArelCore typing derivations.

Proof of Theorem 17.2:

$$\mathbf{Case} \ \frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_2 \lesssim D : {}^c\tau \qquad \Sigma; \Delta \vdash P \quad wf \qquad \Sigma; \Delta \vdash Q \quad wf \qquad \Sigma; \Delta \models P \subseteq Q}{\Sigma; \Delta; \Phi_a; \Gamma \vdash \mathsf{return} \ t_1 \ominus \mathsf{return} \ t_2 \lesssim 0 : {}^c\{P\} \ \exists_.\tau \ \{Q\} } \ \mathbf{c\text{-}r\text{-}return}$$

By IH on the first premise, we know that exists t'_1 , t'_2 such that:

$$\Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash t_1' \ominus t_2' \downarrow \tau, D \Rightarrow \textcolor{red}{\Phi} (\star)$$

$$\Delta; \Phi_a \models \Phi (\diamond)$$

$$|t_1'| = t_1 \text{ and } |t_2'| = t_2 (\dagger)$$

By using (\star) and the premises, we can conclude using the algorithmic return rule.

$$\frac{\Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash t_1' \ominus t_2' \downarrow \tau, D \Rightarrow \Phi \qquad \Sigma; \Delta \vdash P \quad wf \qquad \Sigma; \Delta \vdash Q \quad wf \qquad \Sigma; \Delta \vDash P \subseteq Q}{\Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash \mathsf{return} \ t_1' \ominus \mathsf{return} \ t_2' \downarrow \ \{P\} \ \exists _. \tau \ \{Q\}, 0 \Rightarrow \Phi} \ \mathbf{alg-r-ret-} \downarrow$$

$$\mathbf{Case} \frac{\Sigma; \Delta; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \lesssim D_1 : {}^c \{P\} \, \exists \vec{\gamma}_1.\tau \, \{P'\} \qquad \Sigma; \Delta, \vec{\gamma}_1 : \vec{\mathbb{L}}; \Phi_a; \Gamma, x : \tau \vdash t_2 \ominus t_2' \lesssim D_2 : {}^c \{P'\} \, \exists \vec{\gamma}_2.\sigma \, \{Q\} }{\Sigma; \Delta; \Phi; \Gamma \vdash \text{let } \{x\} = t_1 \text{ in } t_2 \ominus \text{let } \{x\} = t_1' \text{ in } t_2' \lesssim 0 : {}^c \{P\} \, \exists \vec{\gamma}_1 \vec{\gamma}_2.\sigma \, \{Q\} } \mathbf{c}\text{-}\mathbf{r}\text{-}\mathbf{bind}$$

By IH on the first premise, we know that exists t_1^* , $t_1'^*$ such that:

$$\begin{split} \Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash t_1^* \ominus t_1'^* \downarrow \{P\} \stackrel{\text{diff}(D)}{\exists \vec{\gamma}_1.\tau} \{P'\}, D_1 \Rightarrow \Phi_1 \ (\star) \\ \Delta; \Phi_a \models \Phi_1 \ (\diamond) \\ |t_1^*| = t_1 \text{ and } |t_1'^*| = t_1' \ (\dagger) \end{split}$$

Choose
$$t_1^* = (t_1 : \{P\} \exists \vec{\gamma_1}.\tau \ \{P'\}, D_1)$$
 and $t_1'^* = (t_1' : \{P\} \exists \vec{\gamma_1}.\tau \ \{P'\}, D_1).$

By the rule **alg-r-anno-**↑, we have:

$$\begin{split} &\Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash t_1 \ominus t_1' \downarrow \ \{P\} \ \exists \vec{\gamma_1}.\tau \ \{P'\}, D_1 \Rightarrow \Phi_1 \ (\star) \\ &\overset{\text{diff}(D)}{\underset{\text{diff}(D)}{\text{diff}(D)}} \times \nabla \cdot (\mathbf{P}) \ \exists \vec{\gamma_1}.\tau \ \{P'\}, D_1) \in \Delta \\ &\frac{\Delta; \Phi_a \vdash \{P\} \ \exists \vec{\gamma_1}.\tau \ \{P'\} \ \forall \mathbf{P}\} \ \exists \vec{\gamma_1}.\tau \ \{P'\}, D_1) \in \Delta}{\underset{\text{Σ; Σ; τ_a; $\Gamma \vdash t_1^* \ominus t_1'^* \uparrow \ \{P\} \ \exists \vec{\gamma_1}.\tau \ \{P'\} \Rightarrow [\cdot], D_1, \Phi$}} \text{alg-r-anno-} \uparrow \end{split}$$

By IH on the second premise, we know that exists t_2^* , $t_2'^*$ such that:

$$\begin{split} \Sigma; \Delta; \cdot; & \Phi_a; \Gamma \vdash t_2^* \ominus t_2'^* \downarrow \ \{P'\} \ \exists \vec{\gamma}_2.\sigma \ \{Q\}, D_2 \Rightarrow & \Phi_2 \ (\star \star) \\ \Delta; & \Phi_a \models \Phi_2 \ (\diamondsuit) \\ |t_2^*| & = t_2 \ \text{and} \ |t_2'^*| = t_2' \ (\dagger \dagger) \end{split}$$

By $(\star\star)$, we can show that for $D_2'\in \mathrm{fresh}(\mathbb{R})$ where $\Phi_2'=\Phi_2\wedge D_2\doteq D_2'$

$$\Sigma; \Delta; D'_2, \cdot; \Phi_a; \Gamma \vdash t_2 \ominus t'_2 \downarrow \{P'\} \exists \vec{\gamma}_2 : \tau_2 \{Q\}, D'_2 \Rightarrow \Phi'_2$$

$$\tag{4.2}$$

By the algorithmic rule $alg-r-let-\downarrow$, we can conclude that:

$$\Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash t_1^* \ominus t_1'^* \uparrow \{P\} \ \exists \vec{\gamma}_1 : \tau_1 \ \{P'\} \Rightarrow [\psi_1], D_1, \Phi_1 \qquad D_2' \in \operatorname{fresh}(\mathbb{R})$$

$$\frac{\Sigma; \Delta; D_2'; \Phi_a; \Gamma \vdash t_2 \ominus t_2' \downarrow \{P'\} \ \exists \vec{\gamma}_2 : \tau_2 \ \{Q\}, D_2' \Rightarrow \Phi_2' \qquad \Phi = \Phi_2' \land D_1 + D_2' + D + D' \stackrel{\cdot}{=} D''}{\Sigma; \Delta; \cdot; \Phi_a; \Gamma \vdash \operatorname{let} \{x\} = t_1^* \ \operatorname{in} \ t_2 \ominus \operatorname{let} \{x\} = t_1'^* \ \operatorname{in} \ t_2' \downarrow \ \{P\} \ \exists _. \tau_2 \ \{Q\}, 0 \Rightarrow \Phi_1 \land (\exists D_2 :: \mathbb{R}.\Phi)}$$

$$\mathbf{alg-r-bind-} \downarrow$$

In this case, we know that there exists

t = let
$$\{x\} = (t_1 : \{P\} \exists \vec{\gamma}_1.\tau \{P'\}, D_1)$$
 in t_2 and $t' =$ let $\{x\} = (t_1' : \{P\} \exists \vec{\gamma}_1.\tau \{P'\}, D_1)$ in t_2' .
